

METHOD AND APPARATUS FOR TRANSMITTING INFORMATION ON ENHANCED PHYSICAL DOWNLINK CONTROL CHANNEL

ABSTRACT

5 The present invention provides a method and apparatus for transmitting information on an enhanced physical downlink control channel. The transmitting method includes: obtaining, according to a first aggregation level to which a first E-PDCCH candidate belongs, a first eCCE or CCE resource to which the first E-PDCCH candidate is mapped in a first PRB resource, where eCCE or CCE resources to which E-PDCCH candidates on the first
10 aggregation level are mapped in the first PRB resource are different from each other, and the first PRB resource includes a PRB in which an E-PDCCH candidate on each aggregation level and a PDSCH in each subframe are multiplexed; determining a first DMRS port corresponding to a reference signal corresponding to the first E-PDCCH candidate; and respectively transmitting, on a subcarrier corresponding to the first DMRS port and the first
15 eCCE or CCE resource, the reference signal and a data part corresponding to the first E-PDCCH candidate. The technical solution of the present invention solves a transmission problem of the E-PDCCH.
