

Thermoplastic Starch Composition Derives From Agricultural Waste

Field Of Invention

- 5 The present invention relates to a thermoplastic starch composition. More specifically, the disclosed thermoplastic starch composition is produced utilizing agricultural waste containing relatively low starch content under an optimized process.

Background Of The Invention

- 10 Starch is a natural polymer composed mainly of two major polysaccharides, namely the linearly linked amylose and the branched amylopectin. Starch possesses thermoplastic behavior though it exists in granular form in its natural state. Starch can be transformed into a molten plastic state, known as thermoplastic starch (TPS), when subjected to shearing force at a temperature of 90 to 180⁰C in the presence of suitable plasticizer.
- 15 In the thermoplastic starch, the weaker hydrogen bond between the polysaccharides and the plasticizer replaces the original inter-polysaccharides hydrogen bond rendering the thermoplastic starch soft and ductile. Specifically, the new bonding between the plasticizer and the polysaccharides greatly reduces the secondary bonds holding the long chain polysaccharides. In view of that starch is a
- 20 renewable resource, thermoplastic starch is a sustainable product. Yet, it suffers from two major shortcomings, high water solubility and poor mechanical strength, compared to conventional synthetic plastic. In order to improve TPS mechanical property and reduce its water absorbing properties, modification have been made to the TPS. For example, European patent application no. 0327505 describes a
- 25 polymeric blend of TPS and water insoluble synthetic thermoplastic polymer claiming a derived polymeric composition with better mechanical property and reduced water solubility. Guy et. al. claims another TPS derived thermoforming compound containing at least one hydroxycarboxylic acid salt that the compound acquired is claimed to have maximum loss tangent in wide range of temperature in Canadian
- 30 patent application no. 2060409. Further TPS modification can be found in International patent publication no. 03074604 which provides TPS-grafted polymers formed using compatibilizer instead of plasticizer to reduce water absorption into the

formed polymer. Co-continuous TPS substantially free of water is described in United States patent application no. 6605657 and TPS reinforced by particulate filler is disclosed in another United States patent application no. 6231970.

5 In recent years, a lot of effort has been put into utilizing agro-industrial wastes for the manufacturing of value-added products such as biofuels, biomaterials and the like. Recycling these agro-industrial waste can alleviate environmental problems associated with the waste disposal and reduce dependence on petroleum resources. Considering that TPS is a product necessary using starch as the major forming
10 constituent, it is practical to employ such waste of agro-industrial in its production as long as some technical problems inherited from such use are solved. For instance, agro-industrial waste contains much lower starch content compared to normal starch granule that TPS derived thereof may fail to attain the desired plasticity and degradability. Yet, the present invention provides an agricultural waste-derived TPS
15 composition possessing physiochemical properties which meets the industrial acceptable standard in terms of mechanical properties as well International definition for a bio-based material.

Summary Of The Invention

20 The present invention aims to provide a thermoplastic starch (TPS) composition derived from agro-industrial waste. More precisely, the agro-industrial waste used in the present invention is relatively lower in starch content and have subjected to special processing stage in order to achieve the desired property.

25 Another object of the disclosed invention is to disclose a polymer composition containing at least 25% by weight of renewable carbon based on test method in The American Society For Testing and Material (ASTM) D6866 meeting the bio-based standard as setting forth by the Japan BioPlastic Association (JBPA), United State Department of Agriculture (USDA) as well as DIN Certco and Vincotte in Europe.

Further object of the disclosed invention is to offer a TPS composition of agro-industrial waste being acquired through a single compounding process through a unique screw configuration in the extrusion stage.

- 5 Still, another object of the disclosed invention is to offer a TPS composition obtained from pre-treated agro-industrial waste.

At least one of the preceding objects is met, in whole or in part, by the present invention, in which one of the embodiments of the present invention includes a
10 thermoplastic starch composition acquired from compounding a mixture comprising starch-containing agricultural waste in 45 to 70% by weight of total composition that the agricultural waste contains starch content less than 50% in dry weight; thermoplastic synthetic polymer in 25 to 50% by weight of total composition; plasticizer in 1 to 10% by weight of total composition; and coupling agent in 1 to 5%
15 by weight of total composition; wherein the compounding is performed at a first temperature which is higher than room temperature. Preferably, the agricultural waste is pre-treated or functionalized with a reactant having functional group selected from the group consisting of primary alkylamine, secondary alkylamine, tertiary alkylamine, stearate ester, oleate ester, ecuate ester, ethoxy, methoxy, silane, vinyl,
20 hydroxyl or any combination thereof at a second temperature, which is higher than room temperature but lower than the first temperature, prior to compounding the mixture. More preferably, the agricultural waste is pulverized powder of tamarind kernel, ratanjot, castor seed, Jatropha seeds, moringa seed, neem seed, cocoa bean skin, coffee bean skin, rice husk, sugar cane bagasse, coconut fiber, palm oil fruit
25 bunch, wood chips, and saw dust.

In another respect, the thermoplastic synthetic polymer is vinylpolymer, polystyrenes, polylactic acid, polyhydroxyl adipate or polyvinyl alcohol, polyacrylonitriles, polyvinylcarbazols, poly(alkylene oxides), poly(hydroxy butyrate), polyimides,
30 polyarylethers, poly(alkylene terephthalates), polycarbonates, polyester, polypropylene, polyethylene, and polyisobutylenes.

In another aspect, the disclosed TPS composition further comprises an initiator in 0.01 to 5% by weight of total composition, wherein the initiator is selected from any one or combination of sodium peroxide, tert-butyl hydroperoxide, di-tert-butyl peroxide, and dicumyl peroxide.

In another aspect, the mixture further comprises filler in 25 to 35% by weight of total composition that the natural filler is pulverized powder of any one or combination of wood, kenaf, coconut husk and rice husk. Preferably, the pulverized powder has a particle size not more than 170 micron.

In another aspect, the mixture further comprises a processing aid in 0.2 to 2% by weight of total composition selected from any one or combination of non-metallic stearates, paraffin wax, polyester wax, stearyl stearate, distearyl phthalate, pentaerythritol adipate stearate, ethylene glycol distearate, pentaerythritol tetrastearate, glycerol tristearate, polyethylene glycol monostearate, glycerol monooleate, glycerol distearate, N,N-ethylene bis-stearamide, fatty acids derivatives and the like.

In another aspect, the mixture further comprises plasticizer in 0.01 to 10% by weight of total composition. Preferably, the plasticizer used in preparing the TPS composition is any one or combination of sugar alcohol, polyols, sorbitl ethoxylate, glycerol ethoxylate, pentaerythritol ethoxylate, sorbitol acetate, pentaerythritol acetate, water, urea or urea derivatives, anhydrides of sugar alcohols, phthalate esters, dimethyl and diethylsuccinate and related esters, glycerol monoacetate, glycerol diacetate, glycerol triacetate, glycerol mono acid esters, citric acid esters, adipic acid esters, stearic acid esters, oleic acid esters, copolymers of ethylene and acrylic acid, polyethylene grafted maleic acid, polybutadiene-co-acrylic acid, polybutadiene-co-maleic acid, propylene-co-acrylic acid, polypropylene-co-maleic acid and other hydrocarbon based acid, adipic acid derivatives, benzoic acid derivatives, citric acid derivatives, phosphoric acid derivatives, sebacic acid derivatives, monoglyceride, diglycerides, acetylated monoglyceride, acetylated glycerol monostearate, acetylated glycerol monoester-12-

hydroxystearic acid, esters of glycerin, glycerol monopropionate, glycerol dipropionates and tripropionates, butanoates, stearates, alkylamides, trimethylolpropane, dimethyl sulfoxide, mannitol monoacetate, and mannitol monoethoxylate.

5

In another aspect, the first blend further comprises coupling agent in 0.01 to 5% by weight of total composition. Preferably, the coupling agent is any one or combination of ethylene vinyl acetate, ethylene vinyl alcohol, polyethylene-co-acrylic acid, polyethylene grafted maleic anhydride, maleic anhydride modified polyolefin, maleic anhydride, acrylic acid, vinyl acetate, vinyl alcohol, amino, amide or acrylate, polyvinyl-alcohol-co-vinyl acetate copolymer, ethylene/vinyl alcohol/vinyl acetate copolymers, ethylene/vinyl chloride/vinyl alcohol/vinyl acetate graft copolymers, vinyl alcohol/vinyl acetate/vinyl chloride/diacryl amide copolymers, vinyl alcohol/vinyl butyral copolymers, vinyl alcohol/styrene copolymers, poly acrylic acid-co-vinyl acetate copolymer, ethylene/acrylic acid/vinyl acetate copolymers, ethylene/vinyl chloride/acrylic acid/vinyl acetate graft copolymers, acrylic acid/acrylonitrile copolymer, ethylene/propylene/acrylic acid copolymer, styrene/acrylic acid copolymers, vinyl benzyl amino ethyl amino propyl trimethoxy silane, glycidyl methacrylate modified polymers, graft copolymers of methyl methacrylate

20

According to another preferred embodiment, the disclosed invention is an extruded thermoplastic starch composition comprising starch-containing agricultural waste in 45 to 70% by weight of total composition that the agricultural waste contains starch content less than 50% in dry weight; thermoplastic synthetic polymer in 25 to 50% by weight of total composition; plasticizer in 1 to 10% by weight of total composition; and coupling agent in 1 to 5% by weight of total composition; wherein the agricultural waste and the plasticizer are premixed to form a first blend while the thermoplastic synthetic polymer and the coupling agent are premixed to form a second blend prior to extruding the first and second blends together at a screw extruder having a length/diameter ratio of 30 to 40 by a speed of 200 to 300 rpm under 140°C to 170°C to produce the thermoplastic starch composition. Likewise, this preferred embodiment

30

may further include an initiator in 0.01 to 5% by weight of total composition, wherein the initiator is selected from any one or combination of Sodium peroxide, Tert-butyl hydroperoxide, Di-tert-butyl peroxide, and Dicumyl peroxide

5 **Brief Description Of The Drawings**

Figure 1 is a schematic diagram showing the system boundary for the life cycle assessment study on the TPS composition in Example 1;

10 Figure 2 is a graph showing calculated energy consumption of different produced TPS composition compared to the disclosed TPS composition; and

15 Figure 3 is a graph showing calculated carbon footprint of the disclosed TPS composition compared to TPS compositions derived from other material.

Detailed Description Of The Invention

One skilled in the art will readily appreciate that the present invention is well adapted to carry out the objects and obtain the ends and advantages mentioned, as well as
20 those inherent therein. The embodiment describes herein is not intended as limitations on the scope of the invention.

The "TPS composition" described herein throughout the specification and the appended claims refer to blended polymeric material having thermoplastic starch as
25 constituent and containing one or more additives such as thermoplastic synthetic polymer, coupling agent, filler, antioxidant, coloring agent, masterbatch and the like in molten or solid state.

The present invention is a thermoplastic starch composition acquired from
30 compounding a mixture comprising starch-containing agricultural waste in 45 to 70% by weight of total composition that the agricultural waste contains starch content less than 50% in dry weight; thermoplastic synthetic polymer in 25 to 50% by weight of

total composition; plasticizer in 1 to 10% by weight of total composition; and coupling agent in 1 to 5% by weight of total composition; wherein the compounding is performed at a first temperature which is higher than room temperature. Preferably, the agricultural waste is pre-treated or functionalized with a reactant having functional group selected from the group consisting of primary alkylamine, secondary alkylamine, tertiary alkylamine, stearate ester, oleate ester, ecuate ester, ethoxy, methoxy, silane, vinyl, hydroxyl or any combination thereof at a second temperature, which is higher than room temperature but lower than the first temperature, prior to compounding the mixture. Bringing these reactants with specified functional groups into contact with the agricultural waste prior to the compounding process at the second temperature improves wettability of the agricultural waste rendering better production of the compounded thermoplastic starch composition. Preferably, the reactant is 0.5 to 2.0% by weight of total composition. More preferably, the first temperature mentioned herein ranges between 140 to 170°C and the second temperature is about 65 to 105°C.

According to another preferred embodiment, the functionalised agricultural waste and the plasticizer are premixed to form a first blend while the thermoplastic synthetic polymer and the coupling agent are premixed to form a second blend prior to compounding the first and second blends together to produce the thermoplastic starch composition. Preparing the components into separated blends in the present invention may further improve the yielded thermoplastic starch composition. Accordingly, the first blend and second blend are processed in single extrusion step to form the desired TPS composition.

25

Still, in another preferred embodiment, TPS composition can be acquired through processing the first and second blends in the optimized condition without having the agricultural waste being functionalised by the reactant. Particularly, it is an extruded or compounded thermoplastic starch composition comprising starch-containing agricultural waste in 45 to 70% by weight of total composition that the agricultural waste contains starch content less than 50% in dry weight; thermoplastic synthetic polymer in 25 to 50% by weight of total composition; plasticizer in 1 to 10% by

30

weight of total composition; and coupling agent in 1 to 5% by weight of total composition; wherein the agricultural waste and the plasticizer are premixed to form a first blend while the thermoplastic synthetic polymer and the coupling agent are premixed to form a second blend prior to extruding the first and second blends together at a screw extruder having a length/ diameter ratio of 30 to 60 by a speed of 200 to 300 rpm under 140⁰C to 170⁰C to produce the thermoplastic starch composition.

Preferably, the agricultural waste employed in different embodiments of the present invention is pulverized powder of, but not limited to, tamarind kernel, ratanjot, castor seed, Jatropha seeds, moringa seed, neem seed, cocoa bean skin, coffee bean skin, rice husk, sugar cane bagasse, coconut fiber, palm oil fruit bunch, wood chips, and saw dust. Apart from that, the disclosed TPS composition can utilize as well solid waste produced in starch processing activities from food crops like tapioca, yam, taro, konjac, potato or burdock. The agricultural waste used in the present invention is relatively lower in starch content compared to commercially available product. Particularly, the agricultural waste of the present invention contains starch content less than 50%, more preferably 15% to 50%, in dry weight and amylose content lower than 20%. Food crops used in conventional TPS production contains more than 70% in dry weight of starch content and amylose content not lower than 25% by weight. Presence of large amount of non-starch material, such as fibre content not lower than 10% by weight, in these wastes can significantly affect mechanical property and plasticity of the formed TPS composition. To produce TPS composition meeting industrial standard from these wastes, the agricultural waste needs to be functionalised first in order to react better with the rest of the components in the subsequent compounding process. Or having the agricultural waste and other ingredients for the production of the TPS preferably prepared into two different blends prior to compounding or extruding the two blends, namely the first blend and the second blend, together to finally acquire the TPS composition without going through the functionalising step. Essentially, the first blend in the present invention comprises mixture of the starch-containing agricultural waste and the plasticizer. The starch-containing agricultural waste and the plasticizer are pre-mixed in a mixer at the speed

of 50 to 500 rpm for a duration of 5 to 30 minutes. In contrast, the thermoplastic synthetic polymer and the coupling agent are premixed using a low shear mixer or tumbler mixer for a period of 10 to 30 minutes rather than being subjected to high shearing force in the pre-mix of first blend. According to one embodiment, both first
5 blend and second blend are fed and processed in a twin screw extruder with a length to diameter ratio of 30 to 60, more preferably at 50 to 55, in a temperature of 140 to 170°C with screw speed of 200 to 300 rpm. The elevated temperature in the extruder melts portion of mixed the first and second blends to produce the TPS composition. Further, the screw is configured to handle high vapour volume generated from the
10 starch-containing agricultural waste during mixing. Nevertheless, the disclosed TPS composition can be obtained as well through firstly subjecting the agricultural waste to functionalising and subsequent blends preparation prior to final compounding.

Preferably, the thermoplastic synthetic polymer employed in the present invention is
15 water insoluble. The thermoplastic synthetic polymer can be vinylpolymer such as poly(vinyl chloride) and poly(vinyl acetates), polystyrenes, polylactic acid, polyhydroxyl adipate or polyvinyl alcohol, polyacrylonitriles, polyvinylcarbazols, poly(alkylene oxides), poly(hydroxy butyrate), polyimides, polyarylethers, poly(alkylene terephthalates), polycarbonates, polyester, polyolefin like
20 polypropylene, polyethylene, and polyisobutylenes. It is likely as well thermoplastic copolymers like ethylene/vinyl acetate copolymer, ethylene/vinyl alcohol copolymer, ethylene/acrylic acid copolymers, ethylene/ethyl acrylate copolymers, ethylene/methyl acrylate copolymers; acrylonitrile/butadiene/styrene copolymer, styrene/acrylonitrile copolymer or any combination derived thereof to be used for
25 production of the disclosed TPS composition. The amount of thermoplastic synthetic polymer used in the present invention preferably ranges from 25 to 50%, more preferably in between 25 to 40% by weight of total composition.

In order to produce the disclosed TPS composition through a single extrusion process,
30 an initiator in an amount of 0.01 to 5% by weight of total composition is added to initiate the polymerization process of the thermoplastic synthetic polymer in the second blend. Preferably, the initiator is selected from any one or combination of

Sodium peroxide, Tert-butyl hydroperoxide, Di-tert-butyl peroxide, and Dicumyl peroxide.

The disclosed invention also includes plasticizer in order to have the starch-containing agricultural waste attained the desired plasticity to be workable in further process. Owing to the fact that starch has melting temperature approaches the decomposition temperature, mere heating the starch-containing agricultural waste fail to completely transform the starch in the waste into its molten state while the molten state of the starch can only be attained in the addition of plasticizer in the TPS forming process.

5 The plasticizer described herein shall refer to any suitable plasticizer capable of producing TPS composton. The plasticizer is any one or combination of sugar alcohol, polyols, sorbitol ethoxylate, glycerol ethoxylate, pentaerythritol ethoxylate, sorbitol acetate, pentaerythritol acetate, water, urea or urea derivatives, anhydrides of sugar alcohols, phthalate esters, dimethyl and diethylsuccinate and related esters, 10 glycerol monoacetate, glycerol diacetate, glycerol triacetate, glycerol mono acid esters, citric acid esters, adipic acid esters, stearic acid esters, oleic acid esters, copolymers of ethylene and acrylic acid, polyethylene grafted maleic acid, polybutadiene-co-acrylic acid, polybutadiene-co-maleic acid, propylene-co-acrylic acid, polypropylene-co-maleic acid and other hydrocarbon based acid, adipic acid 15 derivatives, benzoic acid derivatives, citric acid derivatives, phosphoric acid derivatives, sebacic acid derivatives, onoglyceride, diglycerides, acetylated monoglyceride, acetylated glycerol monostearate, acetylated glycerol monoester-12-hydroxystearic acid, aesters of glycerin, glycerol monopropionate, glycerol dipropionates and tripropionates, butanoates, stearates, alkylamides, 20 trimethylolpropane, dimethyl sulfoxide, mannitol monoacetate, and mannitol monoethoxylate.

To gain better compatibility and dispersion characteristics of the starch and the thermoplastic synthetic polymer in the produced TPS composition, coupling agent, 30 also known as compatibilizer, is used. The coupling agent can be placed in the mixture for compounding with the functionalised agricultural waste. As described above, the coupling agent is added into the second blend in the embodiment having

separated blends for the compounding. Under heated and pressurized environment, presence of the coupling agent promotes covalent linkage formation in between the starch and the thermoplastic synthetic polymer. More specifically, the coupling agents are generally hydrophobic polymers which carries a functional group particularly to react and bind with hydroxyl group in the starch while the rest of the hydrophobic portion interacts with the thermoplastic synthetic polymer. The addition coupling agent allows the starch to indirectly bind with the thermoplastic synthetic polymer therefore forming a physically strong composition collectively. Relying on the types of thermoplastic synthetic polymer used and the derived TPS composition, the coupling agent can be any one or combination of ethylene vinyl acetate, ethylene vinyl alcohol, polyethylene-co-acrylic acid, polyethylene grafted maleic anhydride, maleic anhydride modified polyolefin, maleic anhydride, acrylic acid, vinyl acetate, vinyl alcohol, amino, amide or acrylate, polyvinyl-alcohol-co-vinyl acetate copolymer, ethylene/vinyl alcohol/vinyl acetate copolymers, ethylene/vinyl chloride/vinyl alcohol/vinyl acetate graft copolymers, vinyl alcohol/vinyl acetate/vinyl chloride/diacryl amide copolymers, vinyl alcohol/vinyl butyral copolymers, vinyl alcohol/styrene copolymers, poly acrylic acid-co-vinyl acetate copolymer, ethylene/acrylic acid/vinyl acetate copolymers, ethylene/vinyl chloride/acrylic acid/vinyl acetate graft copolymers, acrylic acid/acrylonitrile copolymer, ethylene/propylene/acrylic acid copolymer, styrene/acrylic acid copolymers, vinyl benzyl amino ethyl amino propyl trimethoxy silane, glycidyl methacrylate modified polymers, graft copolymers of methyl methacrylate

One of the embodiments of the produced TPS composition includes as well filler. Preferably, the filler is mixed with the first blend or the mixture directly according to the mode of operation in producing the TPS composition. It is in an amount of 25 to 35% by weight of total composition. The resulting TPS composition can greatly affected by the chemical and physical properties of the filler especially the rheology of the formed TPS. Depending on its melting point, the filler may present as discrete particles separated from the bound matrix of the starch and the thermoplastic synthetic polymer or being melted to partially or completely integrated into the bound matrix of the starch and the thermoplastic synthetic polymer. With melting temperature higher

than the processing temperature, presence of the solid filler particulate in the molten starch and thermoplastic synthetic polymer increase the viscosity of the total mixture thus affecting the morphology of the derived TPS composition. More preferably, the filler in the present invention is made of organic material or being natural origin which is any one or combination of wood, kenaf, coconut husk, rice husk, seagel, cork, seeds. The natural filler is preferably prepared into the form of pulverized powder with a particle size not more than 170 micron. Nonetheless, other inorganic or metal filler like metallic flakes may be incorporated in the disclosed TPS composition in other embodiments relying upon the TPS composition resulted.

To further improve workability and flexibility of the disclosed TPS composition, the disclosed invention, in one embodiment, includes lubricating agent in 0.2 to 2% by weight of total composition. Preferably, the lubricating agent is inert in relative to the plasticizer and prepared in the first blend. The lubricating agent can be selected from any one or combination of non-metallic stearates, paraffin wax, polyester wax, stearyl stearate, distearyl phthalate, pentaerythritol adipate stearate, ethylene glycol distearate, pentaerythritol tetrastearate, glycerol tristearate, polyethylene glycol monostearate, glycerol monooleate, glycerol distearate, N,N-ethylene bis-stearamide, fatty acids derivatives and the like .

Still, the TPS composition, particularly in the first blend, may further comprise antioxidant or ant-oxidative agent in an amount of 0.2 to 1% by weight of total composition to prevent polymer degradation in the TPS forming process caused by the applied heat.

To improve aesthetic effect of the products derived from the TPS composition, the second blend forming the disclosed TPS composition may be further furnished with coloring agent in an amount of 3 to 10% by weight of total composition in one of the embodiments. The coloring agent can be of organic or inorganic origin or azo dyes.

Still, color masterbatch of 3 to 10% by weight of total composition is added into the second blend to impart the desired color to the produced TPS composition. Another embodiment of the disclosed composition may have additive masterbatch in the

amount of 0.1 to 10% by weight of total composition processed together with the first and second blends to produce TPS composition with improved physiochemical properties particularly in antistatic, anti-microbial, anti-oxidative, corrosion resistance, UV resistance and so on.

5

Pursuant to another preferred embodiment, the present invention also disclosed a method of producing thermoplastic starch composition comprising the steps of compounding starch-containing agricultural waste together with a mixture of a thermoplastic synthetic polymer in 25 to 50% by weight of total composition, a plasticizer in 1 to 10% by weight of total composition, and a coupling agent in 1 to 10 5% by weight of total composition at a first temperature higher than room temperature, wherein the starch-containing agricultural waste is 45 to 70% by weight of total composition and the agricultural waste contains starch content less than 50% in dry weight. Preferably, the disclosed method further comprises the step of reacting 15 the starch-containing agricultural waste with a reactant having functional group selected from the group consisting of primary alkylamine, secondary alkylamine, tertiary alkylamine, stearate ester, oleate ester, ecucate ester, ethoxy, methoxy, silane, vinyl, hydroxyl or any combination thereof at a second temperature, which is higher than room temperature but lower than the first emperature, prior to the compounding 20 step. Accordingly, the first temperature is 140⁰C to 170⁰C while the second temperature is around 65⁰C to 105⁰C.

Like in the foregoing description, the agricultural waste used in the disclosed method is relatively lower in starch content compared to commercially available product. 25 Particularly, the agricultural waste of the present invention contains starch content less than 50%, more preferably 15% to 50%, in dry weight and amylose content lower than 20%. Food crops used in conventional TPS production contains more than 70% in dry weight of starch content and amylose content not lower than 25% by weight. Presence of large amount of non-starch material, such as fibre content not lower than 30 10% by weight, requires the agricultural waste to be pre-treated or functionalised first before proceeding to compounding. Preferably, the agricultural waste is pulverized powder of, but not limited to, tamarind kernel, ratanjot, castor seed, Jatropha seeds,

moringa seed, neem seed, cocoa bean skin, coffee bean skin, rice husk, sugar cane bagasse, coconut fiber, palm oil fruit bunch, wood chips, and saw dust. Apart from that, the disclosed method can utilize as well solid waste produced in starch processing activities from food crops like tapioca, yam, taro, konjac, potato or burdock.

In one embodiment, the mixture further comprising an initiator in 0.01 to 5% by weight of total composition that the initiator is selected from any one or combination of Sodium peroxide, Tert-butyl hydroperoxide, Di-tert-butyl peroxide, and Dicumyl peroxide. Similarly, the mixture may further comprise as well a filler in 25 to 35% by weight of total composition, an antioxidant in 0.2 to 1% by weight of total composition, coloring agent in 3 to 10% by weight of total composition or any combination derived thereof.

In order to obtain the TPS composition of desired physiochemical properties, the plasticizer used in the disclosed method can be any one or combination of sugar alcohol, polyols, sorbitl ethoxylate, glycerol ethoxylate, pentaerythritol ethoxylate, sorbitol acetate, pentaerythritol acetate, water, urea or urea derivatives, anhydrides of sugar alcohols, phthalate esters, dimethyl and diethylsuccinate and related esters, glycerol monoacetate, glycerol diacetate, glycerol triacetate, glycerol mono acid esters, citric acid esters, adipic acid esters, stearic acid esters, oleic acid esters, copolymers of ethylene and acrylic acid, polyethylene grafted maleic acid, polybutadiene-co-acrylic acid, polybutadiene-co-maleic acid, propylene-co-acrylic acid, polypropylene-co-maleic acid and other hydrocarbon based acid, adipic acid derivatives, benzoic acid derivatives, citric acid derivatives, phosphoric acid derivatives, sebacic acid derivatives, onoglyceride, diglycerides, acetylated monoglyceride, acetylated glycerol monostearate, acetylated glycerol monoester-12-hydroxystearic acid, esters of glycerin, glycerol monopropionate, glycerol dipropionates and tripropionates, butanoates, stearates, alkylamides, trimethylolpropane, dimethyl sulfoxide, mannitol monoacetate, and mannitol monoethoxylate.

In another embodiment of the disclosed method, the mixture further comprises a processing aid in 0.2 to 2% by weight of total composition selected from any one or combination of non-metallic stearates, paraffin wax, polyester wax, stearyl stearate, distearyl phthalate, pentaerythritol adipate stearate, ethylene glycol distearate, pentaerythritol tetrastearate, glycerol tristearate, polyethylene glycol monostearate, glycerol monooleate, glycerol distearate, N,N-ethylene bis-stearamide, and fatty acids derivatives.

Example 1

In order to prepare sample 1, the starch residue (waste) is pre-treated or functionalized with alkyl amine and esters blends in the presence of dicumyl peroxide in a high speed mixer that are able to be heated up to 120°C for a period of 10 min. After this pre-treatment process, Di-substituted glycerol will be added into the starch residue and mixed for 5 min prior to the addition of other components like calcium stearate, butylated hydroxytoluene, acetate copolymers and PP to be mixed for a further 5 min before discharging the mixed composition into a gravimetric feeder of a twin screw extruder for reactive extrusion/ compounding process to take place. The setting of the temperature for reactive extrusion and compounding process is 140 -170°C for the barrels and the screw speed is 200 rpm. Resins obtained from the twin screw extruder is then dried at 80°C for a minimum of 2 hrs before sheet extrusion using a single screw extruder with an L/D of 25 to produce extruded sheet having a thickness of 0.5 mm and width of 370 mm for mechanical tests using a Universal Tensile Testing machine. The dumbbell test pieces are conditioned for a period of 48 hrs at 20°C/ 55% RH before tests.

For acquiring sample 2, the kernel powder (waste) is pre-treated or functionalized with silanol in the presence of dicumyl peroxide in a high speed mixer that are able to be heated up to 120°C for a period of 10 min. After this pre-treatment process, amides and fatty acids derivatives will be added into the kernel powder and mixed for 5 min prior to the addition of other components like oxidized PE wax, butylated hydroxytoluene, maleic anhydride grafted polystyrene and polystyrene (PS) to be mixed for a further 5 min before discharging the mixed composition into a gravimetric

feeder of a twin screw extruder for reactive extrusion/ compounding process to take place. The setting of the temperature for reactive extrusion and compounding process is 140 -160°C for the barrels and the screw speed is 200 rpm. Resins obtained from the twin screw extruder is then dried at 80°C for a minimum of 2 hrs before sheet extrusion using a single screw extruder with an L/D of 25 to produce extruded sheet having a thickness of 0.5 mm and width of 370 mm for mechanical tests using a Universal Tensile Testing Machine. The dumbbell test pieces are conditioned for a period of 48 hrs at 20°C/ 55% RH before tests.

10 Mechanical properties of the sample 1 and 2 are presented in table 1 below.

Table 1

<i>Formulations</i>	<i>Sample 1</i>	<i>Sample 2</i>

Example 2

Carbon footprint of sample 1 in example 1 (from cradle to polymer factory gate) was calculated according PAS 2050 [1]. The PAS 2050 allows immaterial emissions to be excluded i.e. any single source resulting in less than 1% of total emissions. However, the total proportion of immaterial emission sources cannot exceed 5% of the full product carbon footprint. Hence the carbon footprint for surface modifier, catalyst, compatibilizers and other additives have been excluded.

For the starch residue, calculation include diesel used for the transportation from supplier (i.e. 13 kg of diesel for a 26 km distance) as well as electricity used for the processing e.g. drying and pulverization of starch residue (i.e. 0.26 kWh/ kg of starch residues). The energy use for the cultivation of the plant where the starch come from is excluded as the present invention is using only the waste or starch residue from the starch production.

For the recycle PP, calculation include diesel used for the transportation from supplier (i.e. 5 kg of diesel for a 10 km distance) as well as energy used for the pelletizing of recycle PP (0.06 kWh/ kg of recycle PP). And the embodied energy for recycle PP is 36 -44 MJ/ kg and carbon footprint is 1.1 – 1.2 kg CO₂e/ kg recycle PP as reported by M. F. Ashby [2].

For the Di-substituted glycerol, calculation include diesel used for the transportation from supplier (i.e. 4 kg of diesel for a 8 km distance) as well as energy used for the production of Di-substituted glycerol which is obtained from the supplier (i.e. 52.33 MJ/ kg of product and its CO₂ emission is 1.96 kgCO₂e/ kg of product).

Production energy for the TPS composition in Example 1 include electricity used for pre-mixing (i.e. 0.06 kwh/ kg) as well as electricity used for reactive extrusion (i.e. 0.94 kwh/ kg) to produce Example 1 in resins form.

Fossil energy used for the transportation of the starch residues from supplier followed by the processing of starch residues = 1.00 MJ/ kg

Fossil energy used for the transportation of the recycle PP from supplier followed by the processing of the recycle plastics = 36.20 MJ/ kg

- 5 Fossil energy used for the production and transportation of the Di-substituted glycerol from supplier = 52.35 MJ/ kg

Fossil energy used for pre-mixing = 0.22 MJ/ kg

- 10 Fossil energy used for reactive extrusion = 3.38 MJ/ kg

Fossil energy for the manufacturing of Example 1 = $0.60 (1.00) + 0.30 (36.2) + 0.05 (52.35) + 0.22 + 3.38 = 17.7$ MJ/ kg

- 15 Carbon footprint used for the transportation of the starch residues from supplier followed by the processing of starch residues = 0. 16 kg CO₂e/ kg

Carbon footprint used for the transportation of the recycle PP from supplier followed by the processing of the recycle PP = 1.14 kg CO₂e / kg

20

Carbon footprint used for the production and transportation of the Di-substituted glycerol from supplier = 1.96 kg CO₂e / kg

Carbon foot print used for pre-mixing = 0.04 kg CO₂e / kg

25

Carbon foot print used for reactive extrusion = 0.59 kg CO₂e / kg

Carbon footprint for the manufacturing of Sample 1 = $0.6 (0.16) + 0.30 (1.14) + 0.05 (1.96) + 0.04 + 0.59 = 1.17$ kg CO₂e / kg

30

The calculated fossil energy consumption and carbon footprint of sample 1 were used to compare with other materials. The comparison shows that the sample 1 of the

disclosed composition is far more energy efficiency and significantly lower in carbon footprint. The details of the comparison are shown in figure 2 and 3.

Changes therein and other uses will occur to those skilled in the art which are encompassed within the scope of the invention as defined by the scope of the claims.

Claims

1. A thermoplastic starch composition acquired from compounding a mixture
5 comprising
starch-containing agricultural waste in 45 to 70% by weight of total composition
that the agricultural waste contains starch content less than 50% in dry weight;
thermoplastic synthetic polymer in 25 to 50% by weight of total composition;
plasticizer in 1 to 10% by weight of total composition; and
10 coupling agent in 1 to 5% by weight of total composition; wherein the
compounding is performed at a first temperature which is higher than room
temperature.
2. A composition of claim 1, wherein the agricultural waste is pre-treated or
15 functionalized with a reactant having functional group selected from the group
consisting of primary alkylamine, secondary alkylamine, tertiary alkylamine,
stearate ester, oleate ester, ecuate ester, ethoxy, methoxy, silane, vinyl,
hydroxyl or any combination thereof at a second temperature, which is higher
than room temperature but lower than the first temperature, prior to
20 compounding the mixture.
3. A composition of claim 1, wherein the agricultural waste and the plasticizer
are premixed to form a first blend while the thermoplastic synthetic polymer
and the coupling agent are premixed to form a second blend prior to
25 compounding the first and second blends together to produce the thermoplastic
starch composition.
4. A composition of claim 2, wherein the reactant is 0.5 to 2.0% by weight of
total composition.
- 30 5. A composition of claim 1, wherein the first temperature is 140⁰C to 170⁰C.

6. A composition of claim 2, wherein the second temperature is 65⁰C to 105⁰C.
7. A composition of claim 1 or 2 further comprising an initiator in 0.01 to 5% by weight of total composition, wherein the initiator is selected from any one or combination of Sodium peroxide, Tert-butyl hydroperoxide, Di-tert-butyl peroxide, and Dicumyl peroxide.
8. A composition of claim 1 or 2 further comprising filler in 25 to 35% by weight of total composition that the filler is pulverized powder of any one or combination of wood, kenaf, coconut husk and rice husk.
9. A composition of claim 7, wherein the pulverized powder has a particle size not more than 170 micron.
10. A composition of claim 1 or 2 further comprising antioxidant in 0.2 to 1% by weight of total composition.
11. A composition of claim 1 or 2 further comprising a processing aid in 0.2 to 2% by weight of total composition selected from any one or combination of non-metallic stearates, paraffin wax, polyester wax, stearyl stearate, distearyl phthalate, pentaerythritol adipate stearate, ethylene glycol distearate, pentaerythritol tetrastearate, glycerol tristearate, polyethylene glycol monostearate, glycerol monooleate, glycerol distearate, N,N-ethylene bis-stearamide, and fatty acids derivatives.
12. A composition of claim 1 or 2 further comprising coloring agent in 3 to 10% by weight of total composition.
13. A composition of claim 1 or 2, wherein the agricultural waste is pulverized powder of tamarind kernel, ratanjot, castor seed, Jatropha seeds, moringa seed, neem seed, cocoa bean skin, coffee bean skin, rice husk, sugar cane bagasse, coconut fiber, palm oil fruit bunch, wood chips, and saw dust.

14. A composition of claim 1 or 2, wherein the thermoplastic synthetic polymer is vinylpolymer, polystyrenes, polylactic acid, polyhydroxyl adipate or polyvinyl alcohol, polyacrylonitriles, polyvinylcarbazols, poly(alkylene oxides),
5 poly(hydroxy butyrate), polyimides, polyarylethers, poly(alkylene terephthalates), polycarbonates, polyester, polypropylene, polyethylene, and polyisobutylenes.
15. A composition of claim 1 or 2, wherein the plasticizer is any one or
10 combination of sugar alcohol, polyols, sorbitl ethoxylate, glycerol ethoxylate, pentaerythritol ethoxylate, sorbitol acetate, pentaerythritol acetate, water, urea or urea derivatives, anhydrides of sugar alcohols, phthalate esters, dimethyl and diethylsuccinate and related esters, glycerol monoacetate, glycerol diacetate, glycerol triacetate, glycerol mono acid esters, citric acid esters,
15 adipic acid esters, stearic acid esters, oleic acid esters, copolymers of ethylene and acrylic acid, polyethylene grafted maleic acid, polybutadiene-co-acrylic acid, polybutadiene-co-maleic acid, propylene-co-acrylic acid, polypropylene-co-maleic acid and other hydrocarbon based acid, adipic acid derivatives, benzoic acid derivatives, citric acid derivatives, phosphoric acid derivatives,
20 sebacic acid derivatives, onoglyceride, diglycerides, acetylated monoglyceride, acetylated glycerol monostearate, acetylated glycerol monoester-12-hydroxystearic acid, esters of glycerin, glycerol monopropionate, glycerol dipropionates and tripropionates, butanoates, stearates, alkylamides, trimethylolpropane, dimethyl sulfoxide, mannitol
25 monoacetate, and mannitol monoethoxylate.
16. A composition of claim 1 or 2, wherein the coupling agent is any one or combination of ethylene vinyl acetate, ethylene vinyl alcohol, polyethylene-co-acrylic acid, polyethylene grafted maleic anhydride, maleic anhydride
30 modified polyolefin, maleic anhydride, acrylic acid, vinyl acetate, vinyl alcohol, amino, amide or acrylate, polyvinyl-alcohol-co-vinyl acetate copolymer, ethylene/vinyl alcohol/vinyl acetate copolymers, ethylene/vinyl

chloride/vinyl alcohol/vinyl acetate graft copolymers, vinyl alcohol/vinyl acetate/vinyl chloride/diacryl amide copolymers, vinyl alcohol/vinyl butyral copolymers, vinyl alcohol/styrene copolymers, poly acrylic acid-co-vinyl acetate copolymer, ethylene/acrylic acid/vinyl acetate copolymers, ethylene/vinyl chloride/acrylic acid/vinyl acetate graft copolymers, acrylic acid/acrylonitrile copolymer, ethylene/propylene/acrylic acid copolymer, styrene/acrylic acid copolymers, vinyl benzyl amino ethyl amino propyl trimethoxy silane, glycidyl methacrylate modified polymers, graft copolymers of methyl methacrylate

17. A method of producing thermoplastic starch composition comprising the steps of

compounding starch-containing agricultural waste together with a mixture of a thermoplastic synthetic polymer in 25 to 50% by weight of total composition, a plasticizer in 1 to 10% by weight of total composition, and a coupling agent in 1 to 5% by weight of total composition at a first temperature higher than room temperature, wherein the starch-containing agricultural waste is 45 to 70% by weight of total composition and the agricultural waste contains starch content less than 50% in dry weight.

18. A method of claim 17 further comprising the step of reacting the starch-containing agricultural waste with a reactant having functional group selected from the group consisting of primary alkylamine, secondary alkylamine, tertiary alkylamine, stearate ester, oleate ester, ecucate ester, ethoxy, methoxy, silane, vinyl, hydroxyl or any combination thereof at a second temperature, which is higher than room temperature but lower than the first emperature, prior to the compounding step.

19. A method of claim 18, wherein the reactant is 0.5 to 2.0% by weight of total composition.

20. A method of claim 17, wherein the first temperature is 140⁰C to 170⁰C.

21. A method of claim 18, wherein the second temperature is 65⁰C to 105⁰C.

22. A method of claim 17 or 18, wherein the mixture further comprising an
5 initiator in 0.01 to 5% by weight of total composition, wherein the initiator is
selected from any one or combination of Sodium peroxide, Tert-butyl
hydroperoxide, Di-tert-butyl peroxide, and Dicumyl peroxide.

23. A method of claim 17 or 18, wherein the mixture further comprising a filler in
10 25 to 35% by weight of total composition, an antioxidant in 0.2 to 1% by
weight of total composition, coloring agent in 3 to 10% by weight of total
composition or any combination derived thereof.

24. A method of claim 17 or 18, wherein the plasticizer is any one or combination
15 of sugar alcohol, polyols, sorbitl ethoxylate, glycerol ethoxylate,
pentaerythritol ethoxylate, sorbitol acetate, pentaerythritol acetate, water, urea
or urea derivatives, anhydrides of sugar alcohols, phthalate esters, dimethyl
and diethylsuccinate and related esters, glycerol monoacetate, glycerol
diacetate, glycerol triacetate, glycerol mono acid esters, citric acid esters,
20 adipic acid esters, stearic acid esters, oleic acid esters, copolymers of ethylene
and acrylic acid, polyethylene grafted maleic acid, polybutadiene-co-acrylic
acid, polybutadiene-co-maleic acid, propylene-co-acrylic acid, polypropylene-
co-maleic acid and other hydrocarbon based acid, adipic acid derivatives,
benzoic acid derivatives, citric acid derivatives, phosphoric acid derivatives,
25 sebacic acid derivatives, onoglyceride, diglycerides, acetylated
monoglyceride, acetylated glycerol monostearate, acetylated glycerol
monoester-12-hydroxystearic acid, esters of glycerin, glycerol
monopropionate, glycerol dipropionates and tripropionates, butanoates,
stearates, alkylamides, trimethylolpropane, dimethyl sulfoxide, mannitol
30 monoacetate, and mannitol monoethoxylate.

25. A method of claim 17 or 18, wherein the mixture further comprising a processing aid in 0.2 to 2% by weight of total composition selected from any one or combination of non-metallic stearates, paraffin wax, polyester wax, stearyl stearate, distearyl phthalate, pentaerythritol adipate stearate, ethylene glycol distearate, pentaerythritol tetrastearate, glycerol tristearate, polyethylene glycol monostearate, glycerol monooleate, glycerol distearate, N,N-ethylene bis-stearamide, and fatty acids derivatives.
