

Abstract**Transport and handover system for storing and removing or relocating storage goods in high-bay warehouses, and storage and retrieval machine**

The invention relates to a transport and handover system for storing and removing or relocating storage goods (I) in high-bay warehouses (2), in particular in a transshipment facility of a seaport or inland port for the storage of standard containers, wherein the high-bay warehouse 1(2) consists of an arbitrary number of warehouse modules (10), which are arranged next to each other in the longitudinal direction and in the width direction of the high-bay warehouse (2) extending transversely to the longitudinal direction and which have a plurality of rack compartments (12) lying one over the other in the vertical direction, said warehouse modules being separated from each other by aisles (II) extending parallel to the storing and removal sides of the rack compartments (12) or warehouse modules (10), wherein at least one storage and retrieval machine (19) that can move back and forth is provided in each aisle (II) for transporting and storing and removing or relocating the storage goods (I), and a storage and retrieval machine (19). Accelerated transfer with fewer steel constructions is achieved in that the high-bay warehouse (2) is designed with at least one transverse conveying device (13; 113), which crosses at least some aisles (II) and conveys the supplied storage goods (I) into the high-bay warehouse (2) and/or out of the high-bay warehouse. For handling of the storage goods (I) provided from below the level of the running rails (20), the base bar of the storage and retrieval machine (19) is designed with a passage opening in a frame-like manner so that the storage goods (I) can be lifted through.
