ABSTRACT

Provided are an electronic money mediation system and an electronic money mediation method for enabling enhancement of the convenience of transactions using different types of electronic money. The electronic money mediation system is provided with a service server (1) that mediates payment using electronic money and reception thereof. A transaction information acquisition unit (11) acquires transaction information by associating payment information from a payer terminal (2) with reception information from a receiver terminal (3). A payment reception processing unit (12) acknowledges completion of a deposit made by a payer (20) into a first account, of the service server (1), for first electronic money which is the same type as that used in the payment made by the payer (20). In response to acknowledgement of the deposit made by the payer (20), a payment transfer processing unit (14) remits, from a second account (61) for second electronic money of the service server (1) to a receiver (30), an amount of second electronic money corresponding to the paid amount of the first electronic money deposited by the payer (20) into the first account (41).
