ABSTRACT

TRIARYLSILYL(METH)ACRYLOYL-CONTAINING POLYMERS

FOR MARINE COATING COMPOSITIONS

Copolymers containing triarylsilyl(meth)acryloyl units are erodible in seawater and can be used to formulate antifouling marine paints. The copolymers are characterized by low levels of triarylsilyl(meth) acrylate units and an erosion rate in seawater of 2 to about 15 microns per month.
