

ABSTRACT

The present disclosure discloses a carrier and a travel device. The carrier includes: a box body portion; and a canopy portion, the canopy portion being detachably connected to the box body portion through a plurality of connection enhancement members, so as to fasten the canopy portion to the box body portion. A first end portion of each of the connection enhancement members is connected to the canopy portion, or each of the connection enhancement members and the canopy portion form an integrated structure, each of the connection enhancement members has a second end portion extending from the canopy portion, and the second end portion of each of the connection enhancement members is detachably connected to the box body portion. Or, each of the connection enhancement members includes a first connection member and a second connection member, the first connection member is connected to the canopy portion, the second connection member is connected to the box body portion, and the first connection member is detachably connected to the second connection member.
