

ABSTRACT OF THE DISCLOSURE

A substrate storage container includes a container main body, first supporting parts and second supporting parts. The container main body includes a back wall and a pair of side walls in order to store a substrate between the side walls. The first supporting parts are oppositely disposed on each side wall in order to support a peripheral edge part of the substrate. The second supporting parts are oppositely disposed on each side wall in order to support the peripheral edge part of the substrate and positioned between the back wall and the first supporting parts. The first supporting parts and the second supporting parts are covered with a resin layer having a lower frictional property than that of the container main body.
