

ABSTRACT

The present application belongs to the technical field of identity recognition. Discloses are an identity recognition method and apparatus, a device and a storage medium. The method comprises: acquiring biological texture information, the biological texture information is used for describing biological textures of a first object, performing feature extraction processing on the biological texture information to obtain a global texture feature and a local texture feature; performing fusion processing on the global texture feature and the local texture feature to obtain fused texture features of the first object; and performing identity recognition on the first object according to the fused texture features of the first object.
