

NMDA RECEPTOR ANTAGONIST AND USE THEREOF

Abstract

The present invention relates to a NMDA receptor antagonist and use thereof. The NMDA receptor antagonist of the present invention is a compound of formula I below, or a pharmaceutically acceptable salt, an enantiomer, a diastereomer, a tautomer, a solvate, an isotopic substituent, a polymorphic substance, a prodrug or a metabolite thereof. In the formula, ring A, ring B, and R₂ are as described herein. The present invention also provides a pharmaceutical composition comprising these compounds, and use of these compounds in the preparation of a drug for treating or preventing NMDA receptor-mediated diseases.
