(54) Title: A LOUVRE SYSTEM

(57) Abstract: A louvre window system has an end clip (10) which is formed with at least one internal drainage channel (14) which can drain water through the end clip (10). A number of such clips can rotate between an open position and a closed position. The clips (10) are aligned when in the closed position which means that water can drain from an upper clip through a lower clip. The clips (10) have a low friction design which means that a larger number of louvres can be rotated by a single handle without placing too much load on the handle and on the louvre operating mechanism. A simple efficient louvre operating mechanism is used to operate the end clips.
