(54) Title: **MAGNETIC JEWELLERY**

(57) **Abstract:** An item of jewellery, e.g. a ring, bracelet, bangle, watch, etc, has one or more magnets (1) in an annular arrangement (2). The magnetic pole(s) of one polarity (e.g. S) are distributed over at least a major sector, and preferably 360 degrees, of the annular arrangement at its radially-outward circumference, while the magnetic pole(s) of the opposite polarity (e.g. N) are presented at the radially-inward circumference of the annular to arrangement. The magnets are at least partially surrounded, but preferably completely enclosed, in decorative metal such as gold, silver, platinum, or their alloys. A perceptible attractive force may be established between a couple wearing a pair of the jewellery items in sufficiently close proximity and having complementary magnetic polarities, e.g. when one person wears a wedding ring having outwardly directed south poles, and the other person wears a wedding ring

having outwardly directed north poles.
