

ABSTRACT

The present invention relates to the technical field of human-computer interaction, and provides a method and apparatus for discarding a virtual prop, a terminal, and a storage medium. The method comprises: when no virtual prop is selected, receiving a first operation on a prop management control, the prop management control being used to trigger management of virtual props possessed by a virtual object; when the virtual props possessed by the virtual object include a useless virtual prop, displaying discard prompt information, the useless virtual prop referring to a virtual prop that cannot be used by the virtual object; when the first operation ends, controlling the virtual object to discard any useless virtual prop owned by the virtual object. Using a solution provided in an embodiment of the present application, the time for discarding a useless virtual prop can be shortened, so that the efficiency of discarding useless virtual props is improved.
