

ABSTRACT

An inversion unit receives an electronic component, inverts the electronic component, and transfers the inverted electronic component to an external component transfer apparatus. The electronic component has a first surface and a second surface that are parallel to each other. A first suction holding member suctions the second surface of the electronic component whose first surface is suctioned by the component transfer apparatus, and receives the electronic component from the component transfer apparatus. A second suction holding member suctions the first surface of the electronic component that is suctioned by the first suction holding member, and receives the electronic component.
