

SAMPLE CARRIER WITH TWEEZERS

5 The present invention relates generally to systems for use in diagnostic testing.

In the medical arena, diagnostic testing is frequently performed to determine if a particular medical condition is present in a given patient. Diagnostic testing systems, which may be referred to as test kits, are manufactured to test for a wide variety of conditions in numerous types of biological test specimens, such as, for example, blood, tissue biopsies, and saliva. Such testing systems may be utilized to determine the presence of particular bacteria, such as *Helicobacter pylori*. Some tests that have been proposed to detect *Helicobacter pylori* include those that are disclosed in numerous U.S. Patents, including, for example, U.S. Patent No. 4,748,113 to Marshall, U.S. Patent No. 5,314,804 to Boguslaski et al., U.S. Patent No. 5,439,801 to Jackson, U.S. Patent No. 5,702,911 to Whalen, U.S. Patent No. 5,989,840 to D'Angelo et al., U.S. Patent No. 6,068,985 to Cripps et al., U.S. Patent No. 6,156,346 to Chen et al., and U.S. Patent No. 6,187,556 to Lee et al., each of such patents being incorporated in their entirety by reference herein.

20 Various embodiments of the present invention are directed to a diagnostic system for diagnostic testing having a carrier having a first well and a second well. A specimen-handling tool may be disposed about at least a portion of one of the wells. The specimen-handling tool may be disposed within a cavity formed in the carrier. The specimen-handling tool may be adapted to manipulate a specimen such as a biopsy sample. An overlying member may be provided and may be disposed adjacent to the top surface of the carrier. The overlying member may be positioned over at least a portion of one or more of the wells and/or the cavity.

The specimen-handling tool may include a pair of cooperating arms. Each arm may include a tip portion and a rear portion, the arms being joined to each other at their rear portions. Each arm may further include a rearward arcuate portion, a forward arcuate portion, and an intermediate arcuate portion that is disposed between the rearward arcuate portion and the forward arcuate portion.

The arcuate portions may be configured so that the area disposed between the pair of arms is approximately hourglass in shape.

Figure 1 discloses an embodiment of a diagnostic system 20 according to the present invention that may be utilized for many types of diagnostic testing. Such diagnostic tests utilize a biological test specimen such as, for example, tissue biopsy, blood or saliva. The diagnostic system 20 may include a carrier 22 and a mechanism by which a user may manipulate a sample of tissue, such as, for example, the specimen-handling tool 24 that is shown in Figures 1, 6 and 10. As depicted in Figure 15, the diagnostic system 20 may further include an overlying member 23.

30 As shown in Figures 1-3, 5, and 12, the carrier 22 may include a first well 26 and a second well 28. The wells 26 and 28 may be defined, at least in part, by the walls 27 and 29, respectively. The wells 26 and 28 may be formed to have a variety of different depths and cross-sectional shapes, some variations of which

are shown in Figures 5, 12-14 and 16. The wells 26 and 28 of the carrier 22 may be variously formed, and may have similar configurations or dissimilar configurations. As shown in Figures 1, 2, and 5, the wells 26 and/or 28 are generally frustoconical in shape, although the wells 26 and/or 28 may be
5 cylindrical or otherwise shaped. The wells 26 and/or 28 may be formed so that, when viewed from the top of the carrier 22, the wells 26 and/or 28 have a non-circular shape, such as an elliptical, square, rectangular, D-shaped or any other shape.

A wide variety of compounds may be disposed within the first and/or
10 second wells that permit the testing of a specimen such as, for example, a tissue biopsy specimen. In some embodiments, compounds such as those described in the patents listed herein may be used in the present invention to test for *Helicobacter pylori*.

One or more projecting members, such as the projecting member 34 that is
15 shown in Figures 12-14, may be disposed within one or both of the wells 26 and 28. At least a portion of the projecting member 34 may be disposed outside of the interior of the wells 26 and/or 28. The projecting member 34 may be integrally formed with the walls 27 and 29, or may be attached to the walls 27 and/or 29. Such projecting members 34 may be configured to assist removal of the specimen
20 such as, for example, a biopsy specimen, from the specimen-handling tool 24. These projecting members 34 may be configured to assist the user in accurately positioning a specimen within the well 26 or 28.

The wells 26 and 28 may also include a step such as the step 32 that is depicted in Figure 13.

25 The carrier 22 may have many different overall exterior shapes, such as, for example, the generally rectangular shape as shown in Figures 1, 2 and 5. The carrier 22 may be alternately shaped, such as, for example, square, oblong, triangular, and the like. The carrier 22 may, as shown in Figures 1-3, include two elongated sides 38, two ends 40 and a surface 44. The ends 40 may be
30 configured to be easily grasped by a user and one, none or both of the ends 40 may include an arcuate portion 42 as shown in Figures 1 - 5.

As shown in Figures 1, 2, 4 and 5, the carrier 22 may include a surface 44. The first and/or second wells 26 and 28, respectively, may be configured to extend

downwardly from the surface 44. As shown in Figures 1 and 2, the carrier 22 may also include a cavity 30. In a similar manner, the cavity 30 may be configured to extend downwardly from the surface 44, as shown in Figures 1, 2 and 5. As shown in Figures 12-14, one or both of the wells 26 and 28 and/or the cavity 30 may be formed so as to extend upwardly from at least a portion of the surface 44.

A mechanism by which a user may manipulate a sample of tissue, such as, for example, the specimen handling tool 24 such as that shown in Figures 1 and 6-11, may also be included in particular embodiments of the diagnostic system 20 of the present invention. The specimen-handling tool 24 may be disposed within the cavity 30.

The cavity 30 may, as shown in Figures 1-3, be configured so that it is disposed about at least a portion of one of the first and/or second wells 26 and 28, respectively. The carrier 22 may also be configured so that a specimen handling tool 24 may be otherwise retained in the carrier 22 so that it is disposed about at least a portion of one of the first and/or second wells 26 and 28, respectively. As shown in Figures 12 and 13, the carrier 22 may be configured so that the specimen-handling tool 24 is secured in a particular position by one or more ribs 84. The specimen-handling tool 24 may be removably attached to the carrier 22 by one or more locking arms, breakaway tabs, adhesive, or the like.

One or more rails 46 may be included in selected embodiments of the present invention and may be disposed on the carrier 22 so that the rails extend upwardly along at least a portion of the surface 44. One or more rails 46 may also be configured to extend outwardly from the carrier 22. At least one gap 48 may be formed in one of the rails 46 that extend along a portion of the carrier 22.

As shown in Figure 3, one or more supports 50 may be provided which extend downwardly from the surface 44. As seen in Figure 3, the supports 50 may be attached to the wall (or walls) 31 that form at least a portion of the cavity 30 and may extend outwardly from those wall 31 to permit the carrier 22 to rest in a stable position on a horizontal or other surface. The rails 46 and the supports 50 may be configured to enable the carrier 22 to be automatically processed through a variety of equipment.

If desired, the surface 44 may be configured so that various indicia, such as letters, numbers, symbols and other characters, may be placed onto or formed

into the surface 44. For example, and as shown in Figure 2, each well 26 and/or 28 may be given a particular designation, such as A or B, and that designation may be printed upon the surface 44.

The carrier 22 may be formed from a variety of materials, including, for example, polycarbonate, polystyrene, polypropylene, polyethylene, polyvinylchloride, or any other type of polyolefin.

Particular embodiments of the specimen-handling tool 24 are shown in Figures 6 – 11 and 17. The specimen-handling tool 24 may include, as shown in Figures 6-9, a pair of cooperating arms 54 and 55. Each arm 54 and 55 may include a tip portion 56 and 57, respectively. The arms 54 and 55 may each also include a rear portion 58 and 59, respectively. The arms 54 and 55 may be joined to each other at their rear portions 58 and 59, respectively, forming a joined end 60. The joined end 60 may be configured to assist the user in accomplishing particular tasks, such as, for example, manipulating a specimen, removing a plug 86 (see Figure 14) from one of the first and/or second wells 26 and 28, respectively, as well as other tasks. The outermost portion of the joined end 60 may be variously configured, and may be formed as a narrow projection, such as that shown in Figure 10.

As seen in Figures 8 and 9, each arm 54 and 55 may also include a rearward arcuate portion 62 and 63, respectively, and a forward arcuate portion 66 and 67, respectively. Disposed between each rearward arcuate portion 62 and 63 and its corresponding forward arcuate portion 66 and 67, respectively, is an intermediate arcuate portion 64 and 65, respectively. The arcuate portions 62-64-66 and 63-65-67 of each arm 54 and 55, respectively, may be configured so that the area disposed between the arms 54 and 55 is approximately hourglass in shape. In such an embodiment, the rearward arcuate portions 62 and 63 and forward arcuate portions 66 and 67 curve outwardly, and the intermediate arcuate portions 64 and 65 curve inwardly.

The intermediate arcuate portions 64 and 65 may be formed so that a user may more easily grip these portions. As shown in Figure 6, one or more ribs 52 may be positioned on the outer surface of the intermediate arcuate portions 64 and 65. Alternately, a portion of the arms 54 and/or 55 may have a roughened

texture to enable a user to more effectively grasp and manipulate the specimen-handling tool 24, such as is shown in Figure 10 at 51.

The arms 54 and/or 55 may include fewer or more arcuate portions than the three arcuate portions described above, such as the specimen-handling tool
5 shown in Figure 11. The arcuate portions of the arms 54 and/or 55 may have a more or less pronounced arcuate shape than what is depicted in Figure 6. For example and as shown in Figures 10 – 12 and 18, other configurations of the arms 54 and 55 may be used in the specimen-handling tool 24.

The tip portions 56 and 57 may be variously formed to enable a user to
10 manipulate a specimen. The tip portions 56 and 57 may be formed to include a surface such as the surfaces 70. The surfaces 70 may be variously shaped and, in particular, one or both of the surfaces 70 may be curved (as shown in Figure 10) or flat (as shown in Figure 6). The surfaces 70 may be rough or smooth. Also, structures such as the ridges 78 that are depicted in Figure 11 may also be
15 positioned on one or more of the surfaces 70. The surfaces 70 may be disposed so that they are at least somewhat facing each other, thereby enabling a user to grasp a specimen and hold it between the surfaces 70. As shown in Figure 10, the tip portions 56 and/or 57 may curve outwardly, and may, in some embodiments such as is shown in Figure 11, end in a relatively sharp edge 74.
20 One or both of the tip portions 56 and 57 may include a point, such as the point 80 shown in Figure 10 or a fork 82, also shown in Figure 10, or any number of other configurations.

The specimen-handling tool may be formed from a variety of materials, including, for example, plastics including polycarbonate, polystyrene,
25 polypropylene, polyethylene, polyvinylchloride, or any other type of polyolefin.

Referring now to Figures 15 and 16, an overlying member 23 may be disposed over at least a portion of the surface 44 of the carrier 22. At least a portion of the cavity 30 may be formed by the wall 31. The overlying member 23 may take the form of an adhesive-backed label that adheres to at least a portion of
30 the surface 44. The overlying member 23 may overlie any combination of the first well 26, the second well 28 and the cavity 30.

The overlying member 23 may also be used to seal the first and second wells 26 and 28, respectively. In some embodiments, the overlying member may

be used to regulate the rate of water vapor transmission to and from the wells 26 and 28 of the carrier 22. The overlying member 23 may also be configured so that, if the overlying member 23 is removed prematurely or inadvertently, it may be easily reapplied to the carrier 22 so that the wells 26 and 28 may be resealed.

5 The overlying member 23 may also be used to retain the specimen-handling tool 24 within the cavity 30. The overlying member 23 may also be configured only to retain the specimen-handling tool 24 within the cavity 30. In some embodiments, the overlying member 23 may be adhered to at least a portion of the specimen-handling tool 24 so that, when the overlying member 23 is removed from the carrier 22, the specimen-handling tool 24 is also removed from the carrier 22. Although this may be accomplished in many different ways, the intermediate arcuate portions 64 and 65 may, when the specimen-handling tool 24 is positioned within the cavity 30, be level with or rise slightly above the surface 44 so as to contact and be adhered to the overlying member 23.

15 As shown in Figure 16, a plug 86 may also be used to at least partially seal each well 26 and 28. In such a configuration, the overlying member 23 does not need to seal the well that contains the plug 86, but may merely be positioned above the well 26 and/or 28. The plug 86 may be formed from a variety of materials, including, for example, rubber, wax, silicone, or any of a variety of plastics. In some embodiments, a film cover 86, shown in Figure 14, may also be applied to a portion of the carrier 22, such as, for example, the well 28.

20 In some embodiments, the overlying member 23 may be adhered or otherwise connected to one or more of the plugs 86 so that, when the overlying member 23 is separated from the carrier 22, one or more of the plugs 86 may also be removed. The plug 86 may also be removed with the specimen-handling tool.

25 The invention may be embodied in other specific forms without departing from the scope and spirit of the inventive characteristics thereof. The present embodiments therefore are to be considered in all respects as illustrative and not restrictive, the scope of the invention being indicated by the appended claims rather than by the foregoing description, and all changes which come within the meaning and range of equivalency of the claims are therefore intended to be embraced therein.

It is emphasized that the Abstract is provided to comply with the rules requiring an abstract that will allow a searcher or other reader to quickly ascertain the subject matter of the technical disclosure. It is submitted with the understanding that it will not be used to interpret or limit the scope or meaning of the claims. 37 CFR 1.72(b).

5

We claim:

1. A system for diagnostic testing comprising:
a carrier comprising a first well and a second well; and
5 a specimen-handling tool disposed about at least a portion of the first well or the second well.
2. The system as claimed in claim 1 further comprising at least one plug disposed in at least one well.
- 10 3. The system as claimed in claim 1 further comprising an overlying member positioned adjacent to the carrier so that the overlying member is disposed over at least a portion of one of the first and/or second wells.
- 15 4. The system as claimed in claim 3 further comprising a plug disposed in at least one of the wells, the plug being attached to the overlying member so that, when the overlying member is removed from the carrier, the plug is removed from the well.
- 20 5. The system as claimed in claim 1, the specimen-handling tool comprising a pair of cooperating arms.
6. The system as claimed in claim 5, each arm of the specimen handling tool comprising a tip portion and a rear portion, the arms being joined to each other at
25 their rear portions to form a joined end.
7. The system as claimed in claim 6, at least one tip portion being formed as a flat surface.
- 30 8. The system as claimed in claim 6, at least one tip portion being formed as a spike.

9. The system as claimed in claim 6, the joined end being formed to include a narrow projection.

10. The system as claimed in claim 5, each arm further comprising a rearward
5 arcuate portion.

11. The system as claimed in claim 5, each arm further comprising a forward arcuate portion.

10 12. The system as claimed in claim 10, each arm further comprising a forward arcuate portion and an intermediate arcuate portion, the intermediate arcuate portion being disposed between the rearward arcuate portion and the forward arcuate portion.

15 13. The system as claimed in claim 12, the arcuate portions being configured so that the area disposed between the pair of arms is substantially hourglass in shape.

14. The system as claimed in claim 1 further comprising indicia disposed on the
20 carrier.

15. The system as claimed in claim 1, at least one of the wells having a frustoconical configuration.

25 16. The system as claimed in claim 1, the carrier being formed from polycarbonate.

17. A system for testing comprising:

30 a carrier comprising at least one well; and
means for handling a specimen, such means disposed about at least a portion of the well.

18. The system as claimed in claim 17, the means for handling a specimen comprising a specimen-handling tool.
19. The system as claimed in claim 18, the specimen-handling tool comprising a
5 pair of cooperating arms, each arm of the specimen-handling tool comprising a tip portion and a rear portion, the arms being joined to each other at their rear portions.
20. The system as claimed in claim 19, the specimen-handling tool further
10 comprising a rearward arcuate portion, a forward arcuate portion, and an intermediate arcuate portion disposed between the rearward arcuate portion and the forward arcuate portion, the arcuate portions being configured so that the area disposed between the pair of arms is approximately hour-glass in shape.
21. The system as claimed in claim 17, further comprising at least one plug
15 disposed in at least one of the first and/or second wells.
22. The system as claimed in claim 17, further comprising an overlying member positioned adjacent to the carrier so that the overlying member is disposed over at
20 least a portion of one of the first and/or second wells.
23. The system as claimed in claim 17 further comprising a plug disposed in at least one of the wells, the plug being attached to the overlying member so that, when the overlying member is removed from the carrier, the plug is removed from
25 the well.
24. The system as claimed in claim 17 further comprising indicia disposed on the carrier.
25. The system as claimed in claim 17, the carrier being substantially rectangular
30 in shape.

26. The system as claimed in claim 17, the carrier being formed from polycarbonate.

27. The system as claimed in claim 17, the well having a frustoconical configuration.

28. The system as claimed in claim 17, the carrier comprising at least two wells.

29. A diagnostic system comprising:

10 a carrier comprising a first well, a second well, and a cavity; and
 a specimen-handling tool adapted to manipulate a specimen, the specimen-handling tool being adapted to fit within the cavity of the carrier so that the specimen-handling tool is disposed about at least a portion of one of the first and/or second wells.

15

30. The diagnostic system as claimed in claim 29, further comprising at least one plug disposed one of the first and/or second wells.

31. The diagnostic system as claimed in claim 29, further comprising an
20 overlying member positioned adjacent to the carrier so that the overlying member is disposed over at least a portion of one of the first and/or second wells.

32. The system as claimed in claim 31 further comprising a plug disposed in at least one of the wells, the plug being attached to the overlying member so that,
25 when the overlying member is removed from the carrier, the plug is removed from the well.

33. The diagnostic system as claimed in claim 31, the overlying member being disposed over at least a portion of the cavity.

30

34. The diagnostic system as claimed in claim 29 further comprising indicia disposed on the carrier.

35. The diagnostic system as claimed in claim 29, the carrier being substantially rectangular in shape.

5 36. The diagnostic system as claimed in claim 29, the specimen-handling tool comprising a pair of cooperating arms.

37. The diagnostic system as claimed in claim 36, each arm of the specimen handling tool comprising a tip portion and a rear portion, the arms being joined to each other at their rear portions to form a joined end.

10

38. The system as claimed in claim 37, the specimen-handling tool further comprising a rearward arcuate portion, a forward arcuate portion, and an intermediate arcuate portion disposed between the rearward arcuate portion and the forward arcuate portion, the arcuate portions being configured so that the area
15 disposed between the pair of arms is approximately hour-glass in shape.

39. The diagnostic system as claimed in claim 29, the carrier being formed from polycarbonate.

20 40. The diagnostic system as claimed in claim 25, at least one of the wells having a frustoconical configuration.

41. A system for diagnostic testing comprising:
a carrier comprising at least one well; and
25 a specimen-handling tool disposed about at least a portion of the well.

42. The system as claimed in claim 41, the carrier comprising a first well and a second well.

30 43. The system as claimed in claim 41, further comprising at least one plug disposed in the well.

44. The system as claimed in claim 41, further comprising an overlying member positioned adjacent to the carrier so that the overlying member is disposed over at least a portion of one of the first and/or second wells.

5 45. The system as claimed in claim 44, the overlying member being disposed over at least a portion of the cavity.

46. The system as claimed in claim 44 further comprising a plug disposed in at least one of the wells, the plug being attached to the overlying member so that,
10 when the overlying member is removed from the carrier, the plug is removed from the well.

47. The system as claimed in claim 41 further comprising indicia disposed on the carrier.

15 48. The system as claimed in claim 41, the carrier being substantially rectangular in shape.

49. The system as claimed in claim 41, further comprising at least one plug
20 disposed in at least one well.

50. The system as claimed in claim 41, the specimen-handling tool comprising a pair of cooperating arms.

25 51. The system as claimed in claim 50, each arm of the specimen handling tool comprising a tip portion and a rear portion, the arms being joined to each other at their rear portions to form a joined end.

52. The system as claimed in claim 50, the specimen-handling tool further
30 comprising a rearward arcuate portion, a forward arcuate portion, and an intermediate arcuate portion disposed between the rearward arcuate portion and the forward arcuate portion, the arcuate portions being configured so that the area disposed between the pair of arms is approximately hour-glass in shape.

53. The system as claimed in claim 41, the carrier being formed from polycarbonate.
54. The system as claimed in claim 41, at least one of the wells having a frustoconical configuration.
55. A carrier comprising:
at least one well; and
a cavity adapted to retain a specimen-handling tool so that the specimen-handling tool is disposed about at least a portion of the well.
56. The carrier as claimed in claim 55 comprising a first well and a second well.
57. The carrier as claimed in claim 55 further comprising a plug disposed in the well.
58. The carrier as claimed in claim 55 further comprising an overlying member positioned adjacent to the carrier so that the overlying member is disposed over at least a portion of the well.
59. The carrier as claimed in claim 58, the overlying member being disposed over at least a portion of the cavity.
60. The carrier as claimed in claim 55 further comprising indicia disposed on the carrier.
61. The carrier as claimed in claim 55, the carrier being substantially rectangular in shape.
62. The carrier as claimed in claim 55, the well having a frustoconical configuration.

63. A specimen handling tool comprising:
a pair of cooperating arms, each arm comprising
a tip portion,
a rear portion, the arms being joined to each other at their rear
5 portions to form a joined end,
a rearward arcuate portion,
a forward arcuate portion, and
an intermediate arcuate portion disposed between the rearward
arcuate portion and the forward arcuate portion, the arcuate portions being
10 configured so that the area disposed between the pair of arms is approximately
hour-glass in shape, at least one tip portion comprising a flat surface.
64. The specimen-handling tool as claimed in claim 63, at least one tip portion
comprising a fork.
15
65. The specimen-handling tool as claimed in claim 63, the specimen-handling
tool being formed from polycarbonate.
66. The specimen-handling tool as claimed in claim 63, the joined end of the
20 specimen-handling tool being configured as a projection.
