

**ABSTRACT**

5 The invention relates to a game controller comprising an assembled  
shell and at least one control member (3) which passes through the  
assembled shell and comprises, outside the assembled shell, a  
head (32) for manipulating the control member (3), which is pivotable  
and can be tilted manually in all directions from a rest position into which  
it returns in a rotationally elastic manner. The game controller further  
10 comprises at least one adjusting element (5A) for adjusting the stop  
angle ( $\alpha$ ) of the control member (3), said adjusting element (5A) being  
able to be removably mounted on the control member (3) and removed  
from the control member (3) without disassembling the shell of the  
game controller; the control member (3) provided with said removable  
15 adjusting element (5A) being able to be tilted manually in each tilt  
direction until it reaches a stop position in which the adjusting  
element (5A) abuts and allows the tilting of the control member (3) to be  
blocked.
