ABSTRACT

BLOCKCHAIN SYSTEMS AND METHODS

A blockchain system and method is provided that enables perpetual financial products to be provided in an efficient manner. The system includes: an oracle feed, defined on a blockchain, the oracle feed representing an off-chain data feed; first and second token pools defined on the blockchain, each token pool including at least one pool token; a smart contract defined by code on the blockchain, the smart contract configured to autonomously transfer pool tokens between the first and second pools according to data of the oracle feed; and first and second contract tokens defined on the blockchain, each contract token associated with the smart contract and the first and second token pools.
