(54) Title: INJECTION DEVICE WITH LOCKING MECHANISM FOR SYRINGE CARRIER

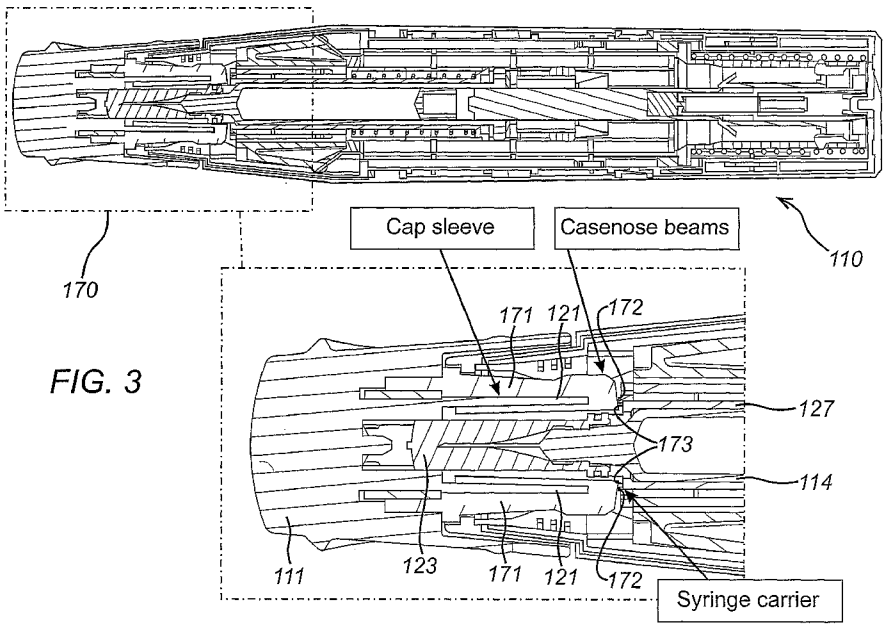

FIG. 3

(57) Abstract: An injection device comprises a locking mechanism (171-173) between a syringe carrier (127) and an end cap (111) of the injection device. The cap is formed in such a way to inhibit movement of the syringe carrier and syringe towards an exit aperture of the injection device when the drive has not been removed from the injection device. On removal of the cap, the locking mechanism is no longer so engaged and the syringe and syringe carrier can move towards the exit capture. This assists in preventing damage to the syringe prior to actuation of the injection device.
