

ABSTRACT

STORAGE CASE

In a storage case 10 for enclosing a memory card, for example, there is provided a storage case which can reliably be prevented from being smudged by dusts and can reliably be prevented from being dropped unintentionally and which is also easy to handle.

A storage case 10 is comprised of a base half 11, a slide half 12 joined to this base half 11 so as to move along in the continuous contact with the base half and a lid 18 integrally formed with this slide half 12 and which opens and closes an opening portion 17 which admits or ejects an enclosed object. When the slide half 12 is slid along in continuous contact with the base half 11, protrusions 21 on the lid 18 move along in continuous contact with cam grooves 20 on the base half 11 to permit the lid 18 to open and close.
