

ABSTRACT

This application provides a communication method, apparatus, and system, to enhance quality of service of a service. The method includes: A terminal device determines first service information, where the first service information is used to describe a feature of a service of the terminal device; and the terminal device sends the first service information to a core network, where the first service information is used by the core network to determine a policy corresponding to the service. In this solution, the terminal device may provide the first service information for the core network, so that the core network can determine the policy for the terminal device based on the first service information. In this way, transmission quality of a data packet of a service of the terminal device is controlled.
