ABSTRACT

Provided are a method for determining a non-contention random access resource, a network device and a terminal device. The method comprises: a network device generating indication information, the indication information indicating a first resource on a first uplink carrier and/or a second resource on a second uplink carrier used by the terminal device for non-contention random access, the frequency of the first uplink carrier and the frequency of the second uplink carrier being different; and the network device sending the indication information to the terminal device. According to the solutions of embodiments of the present invention, the network device sends the indication information to the terminal device, so that the terminal device, when there is the first uplink carrier and the second uplink carrier, can determine the non-contention random access resource .
