

ABSTRACT

Improvements to shower columns or panels

Improvements to shower panels and, more particularly to the lower part of such a panel, connected to the upper one by a metallic protective sleeve (3), characterized in that said lower part comprises a casing in two parts, one of which forming a base (6) and comprising means to allow it being fixated against the usual membrane and to maintain a priming valve (1), while the other (11), which totally covers the first part, and the lower part of the sleeve forms a metallic protecting shell and comprises means for operating the usual pusher (2) of said priming valve and to evacuate the water resulting of the discharging of said priming valve and of the main valve disposed at the upper part of the panel.
