(54) Title: REAL–TIME DOCUMENT MANAGEMENT SYSTEM

(57) Abstract

A real–time document management system is described to assist users to manage and create documents in languages such as HTML. The system includes a computer having a public data area (10) from which the documents can be accessed and a private data area (14) including data relating to the documents. The computer reads the data to produce the documents according to a predetermined format in real time, whereby the documents reflect the current private data (14). Changes to the private data (14) can be made over a network.
