

ABSTRACT OF THE DISCLOSURE

CIRCUIT CARD CONNECTOR WITH ISOLATION BASE ASSEMBLY

5 A circuit card connector that utilizes flexible
circuitry includes one or more isolator portions attached
to its base that serve to substantially isolate the base
of the connector from the circuit board to which the
connector is mounted. The isolator portions include feet
that extend out from the connector and which partially
support the flexible circuitry. These isolator portions
10 are made from thermally insulative material and serve to
prevent heat transfer to the connector base from
occurring during soldering of the flexible circuitry
conductive portions to the circuit board.
