Box III Text of the abstract

A novel polypeptide complex comprising (1) an antigen binding domain, wherein said antigen is not CD3; (2) a domain comprising a Fc region with reduced Fcγ receptor-binding activity; and (3) a CD3-binding domain. Said complex retains the strong anti-tumor activity and superior safety characteristics of a Bispecific T cell Engager (BiTE), has a long-life in blood, and induces cytotoxicity in various cells targeted by substituting the antigen binding domain of the complex.
