REFERENCE TO SEQUENCE LISTING SUBMITTED ELECTRONICALLY

[0002] This application contains a sequence listing, which is submitted electronically via EFS-Web as an ASCII formatted sequence listing with a file name "689296-13CN1 Sequence Listing" and a creation date of April 16, 2019, and having a size of about 727 kb. The sequence listing submitted via EFS-Web is part of the specification and is herein incorporated by reference in its entirety.

15

FIELD OF THE INVENTION

[0003] The present invention generally relates to the use of T cells engineered to express chimeric antigen receptor (CAR), such as an anti-mesothelin CAR alone or in combination with a follicle-stimulating hormone receptor (FSHR) binding domain and/or a dominant negative transforming growth factor- β receptor II (dnTGF β RII) for the treatment of diseases associated with mesothelin expression.

20

BACKGROUND OF THE INVENTION

[0004] Adoptive T cell immunotherapy, in which a patient's own T lymphocytes are engineered to express chimeric antigen receptors (CARs), has shown great promise in treating hematological malignancies. Gill S, et al., *Blood Rev.* 2016; 30(3): 157-167. CARs commonly contain 3 modules: an extracellular target binding moiety, a transmembrane domain (TM domain) that anchors the CAR in the cell membrane, and an intracellular signaling domain (ICD) that transmits activation signals. Upon binding to the target tumor antigen, the CARs can activate the T cells to launch specific anti-tumor response in a major histocompatibility complexes (MHC)-independent manner.

25

30

[0005] Mesothelin (MSLN) is a tumor associated antigen originally identified by Ira Pastan and Mark Willingham at the National Cancer Institute in 1992. Chang K, et al., *Cancer Res.* 1992;

- 52(1): 181-186 and Chang K, et al., *Proc Natl Acad Sci USA*. 1996; 93(1): 136-140. Mesothelin is glycosylphosphatidyl inositol (GPI) anchored glycoprotein with normal expression limited to mesothelial cells lining the pleura, peritoneum, and pericardium but is overexpressed in many malignancies, including malignant pleural mesothelioma (MPM), pancreatic ductal
- 5 adenocarcinoma (PDA), ovarian cancer, lung adenocarcinoma, triple negative breast cancer, endometrial cancer, biliary cancer, gastric cancer, and pediatric acute myeloid leukemia.
- [0006] Mesothelin is synthesized as a 71-kD precursor protein and is cleaved by the endoprotease furin to release the secreted N-terminal region, called megakaryocyte potentiating factor (MPF), whereas the 41-kD mature mesothelin remains attached to the membrane.
- 10 Yamaguchi N, et al., *Biol Chem*. 1994; 269: 805-808. The remaining GPI-linked mature mesothelin can also be shed from the cell through the action of the tumor necrosis factor α -converting enzyme protease. Zhang Y, et al., *Cancer Res*. 2011; 71: 5915-5922.
- [0007] The correlation of serum level of shed mesothelin with disease suggested a potential role for the mesothelin protein in cancer progression. While the biological function of mesothelin is
- 15 not well understood. Mesothelin is known to bind to the ovarian cancer antigen MUC16 (cancer antigen 125) that has been shown to induce cell-to-cell adhesion and possibly contribute to peritoneal seeding and metastatic spread. Gubbels JA, et al., *Mol Cancer*. 2006; 5: 50. Furthermore, mesothelin knockout mice grow and reproduce normally and have no detectable phenotype. Bera TK, et al., *Mol Cell Biol*. 2000; 20: 2902-2906.
- 20 [0008] Follicle-stimulating hormone receptor (FSHR) is G protein-linked receptor found in the ovarian surface epithelium and in some ovarian cancer cell lines and tissues, its distribution may be limited in the reproductive system. Zhang W, et al., *Am J Pathol*. 1996; 148: 47-53. Follicle-stimulating hormone (FSH) is a glycoprotein hormone consisting of α and β chains, and amino acids 33 to 53 of the FSH β chain has been identified to bind to FSHR with high affinity. Agris PF, et al., *J Protein Chem*. 1992; 11: 495-507. In particular, FSH β 33-53 peptide appears functional
- 25 when covalently attached to nanoparticles, providing high selectivity nanoparticle delivery to FSHR-expressing ovarian tumors. Zhang XY, et al., *Cancer Res*. 2009; 69 (16): 6506-6514. It has been reported the expression of FSHR in 50-70% of ovarian cancer tissues, as well as its selective expression on the surface of the blood vessels of a wide range of tumors e.g., renal cell carcinoma, prostate, breast, colon, pancreas, urinary bladder, kidney, lung, liver, stomach, testis,
- 30 and ovary (primary tumor and/or metastases) (Radu et al., *N Engl J Med* 363:1621, 2010; Siraj et al., *BMC Cancer* 13:246, 2013; and Renner et al., *Histopathology* 63:29, 2013). The relatively specific expressions of FSHR on cell surface of malignant tissues make it an attractive target for FSHR tumor immunotherapy.

- [0009] Transforming growth factor-beta 1 (TGF β 1) is a multifunctional secreted protein that regulates cell proliferation, differentiation, and motility, as well as influencing production of the extracellular matrix, neovascularization and immune function. Derynck R, et al., *Nature*. 2003; 425: 577-584. It has been suggested that expression of TGF β 1 and its receptors (TGF β receptor type I and TGF β receptor type II) may play a key role in the proliferation and progression of epithelial ovarian cancer. TGF β may also have adverse effects on tumor cells themselves by promoting terminal differentiation and apoptosis. Tumors may avoid this activity by mutation of their TGF β receptors (TGF β RI and TGF β RII). Ebner R, et al., *Science*. 1993; 260: 1344-1348. Immunosuppressive milieu in many cancers attributed in part, to TGF β signaling can be blocked by using a dominant negative TGF β RII, which is truncated and lacks the intracellular domain necessary for downstream signaling. Wieser R, et al., *Molecular and cellular biology*. 1993; 13: 7239-7247. A clinical trial (NCT00368082) testing the safety and efficacy of the dnTGF β RII receptor in EBV-specific T cells for lymphoma was recently reported. Bollard CM, et al., *J Clin Oncol*. 2018; 36: 1128-1139. More recently, another clinical trial was initiated to assess CAR-T cells directed to prostate-specific membrane antigen (PSMA) co-expressed of dnTGF β RII as an approach for patients with relapsed and refractory metastatic prostate cancer (NCT03089203). Christopher C, et al., *Molecular Therapy*. 2018; 26: 1855-1866.
- [0010] T cell receptors (TCR) is a transmembrane heterodimer containing an alpha and beta chain or delta and gamma chain linked by a disulfide bond. The TCR normally contains the highly variable α and β chains expressed as part of a complex with the invariant CD3 chain molecules. The complementary determining regions (CDRs) within the α and β chains determine the antigen to which the TCR will bind, to thereby activate the T cells, leading to a plethora of immune responses. For example, antigen presenting cells (APCs) digest pathogens and display their fragments on major histocompatibility complex (MHC) molecules. This MHC/antigen complex binds to the TCR while other co-stimulatory molecules (e.g. CD28) are activated leading to T cell activation, proliferation, differentiation, apoptosis, or cytokine release (see, e.g., Samelson, 2011, *Cold Spring Harb Perspect Biol.*, 3(12): a011510). TCRs can also interact with other molecules, including non-peptide antigens such as lipids (Mori and De Libero, 2012, *Immunol Res*, 53, 191-199), metabolic intermediates bound to the MHC like molecule MR1 (Reantragoon et al. 2012, *J Exp Med*, 209: 761- 774.), etc. Initiation of TCR signaling requires co-receptors such as CD4 for helper T cells and CD8 for cytotoxic T cells. These co-receptors act as cellular adhesion molecules that bind their respective MHC molecules and stabilize the interaction of T cells and antigen presenting cells. The TCR is also located in close proximity to a

complex of signaling molecules, which help to mediate T cell activation. These include the CD3 family of proteins (CD3 δ , CD3 ϵ , and CD3 γ) as well as a TCR zeta (ζ) chain (Figure 1) (Wucherpfennig et al. 2010, *Cold Spring Harb Perspect Biol*, 2: a005140).

[0011] There is a need for a more targeted antigen-specific immunotherapy for treatment of certain cancers, such as, for example, ovarian cancer.

BRIEF SUMMARY OF THE INVENTION

[0012] In one general aspect, the invention relates to T cells engineered to express a chimeric antigen receptor (CAR) and uses thereof for treating certain cancers. In another general aspects, the invention relates to T cells engineered to express a modified T cell receptor (TCR) complex containing a follicle-stimulating hormone receptor (FSHR) binding domain. In certain aspects, the invention relates to T cells engineered to express an anti-mesothelin CAR in combination with a modified TCR complex containing a FSHR binding domain and/or dnTGF β R2 for the treatment of diseases associated with mesothelin and /or FSHR expression. In certain aspects, the invention relates to T cells engineered to express a CAR comprising a FSHR binding domain and an antigen binding fragment that binds specifically to a tumor antigen and uses thereof. In certain aspects, the invention relates to T cells engineered to express a CAR targeting mesothelin and/or FSHR and/or a dominant negative transforming growth factor- β receptor II (dnTGF β R2) for the treatment of diseases associated with mesothelin expression.

[0013] Provided herein is an isolated polynucleotide comprising a nucleotide sequence encoding a protein of a modified T cell receptor (TCR) complex. The protein comprises, from the N-terminus to the C-terminus, a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR), and an extracellular domain, a transmembrane domain and an intracellular domain of a CD3 polypeptide selected from the group consisting of a CD3- γ , CD3- δ and CD3- ϵ chain.

[0014] In certain embodiments, the first polypeptide that binds specifically to FSHR can, for example, comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331, and the protein further contains an extracellular domain comprising an amino acid sequence selected from the group consisting of SEQ ID NOs: 433 to 435, respectively; a transmembrane domain comprising an amino acid sequence selected from the group consisting of SEQ ID NOs: 436 to 438, respectively; and an intracellular domain comprising an amino acid sequence selected from the group consisting of SEQ ID NOs: 439 to 441, respectively. In certain embodiments, the protein further comprises a signal peptide. In certain embodiments, the signal

peptide comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 430 to 432.

5 [0015] In certain embodiments, an isolated polynucleotide comprises a nucleotide sequence encoding a protein of a modified TCR complex comprising an amino acid sequence selected from the group consisting of SEQ ID NOs: 442-444.

[0016] In certain embodiments, the isolated polynucleotide further comprises a second nucleotide sequence encoding a chimeric antigen receptor (CAR), wherein the CAR comprises: (a) an extracellular domain comprising an antigen binding fragment that binds specifically to a tumor antigen; (b) a transmembrane domain; and (c) an intracellular signaling domain. The second
10 nucleotide sequence can encode any suitable CAR. Preferably, the second nucleotide sequence encodes a CAR of the present invention, such as a CAR that binds specifically to mesothelin. Examples of the CAR include, but are not limited to, the CARs exemplified in the present application. Preferably, the nucleotide sequence encoding the protein of a modified TCR complex is connected to the nucleotide sequence encoding a CAR via a 2A peptide coding
15 sequence.

[0017] In certain embodiments, an isolated polynucleotide comprises a nucleotide sequence encoding a protein having an amino acid sequence selected from the group consisting of SEQ ID NOs:454-456.

[0018] In certain embodiments, the nucleotide sequence encoding a protein of a modified TCR
20 complex further comprises a third nucleotide sequence encoding a dominant negative form of an inhibitor of a cell-mediated immune response of the immune cell. The inhibitor of a cell-mediated immune response of the immune cell, can, for example, be a transforming growth factor β (TGF- β) receptor. The dominant negative form of the inhibitor can, for example, comprise the amino acid sequence of SEQ ID NO:347. In certain embodiments, the nucleotide sequence
25 encoding the protein of a modified TCR complex is connected to the third nucleotide sequence via a 2A peptide coding sequence.

[0019] In certain embodiments, an isolated polynucleotide comprises a nucleotide sequence encoding a protein having an amino acid sequence selected from the group consisting of SEQ ID NOs:457-459.

30 [0020] In certain embodiments, an isolated polynucleotide comprises a first nucleotide sequence encoding a protein of a modified TCR complex, a second nucleotide sequence encoding a CAR, and a third nucleotide sequence encoding a dominant negative form of an inhibitor of a cell-mediated immune response of the immune cell. In certain embodiments, the first, second and

third nucleotide sequences are connected via a 2A peptide coding sequence. The first, second and third nucleotide sequences can be arranged in any order in the isolated polynucleotide.

[0021] In certain embodiments, an isolated polynucleotide comprises a nucleotide sequence encoding a protein having an amino acid sequence selected from the group consisting of SEQ ID NOs:469-471.

[0022] Also provided herein are isolated polynucleotides comprising a nucleotide sequence encoding a chimeric antigen receptor (CAR). The CAR can, for example, comprise (a) an extracellular domain comprising a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR), and an antigen binding fragment that binds specifically to a tumor antigen; (b) a transmembrane domain; and (c) an intracellular signaling domain. The CAR can optionally further comprise a signal peptide at its amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain.

[0023] In certain embodiments, the first polypeptide that binds specifically to a FSHR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331.

[0024] In certain embodiments, the first polypeptide is connected to the amino terminus or carboxy terminus of the antigen binding fragment via a linker. The linker can, for example, be selected from the group consisting of a G₄S linker, a (G₄S)₂ linker, a (G₄S)₃ linker, a (G₄S)₄ linker, and a (G₄S)₅ linker.

[0025] In certain embodiments, the tumor antigen is selected from the group consisting of mesothelin, folate receptor α , mucin 16 (MUC16), prostate-specific membrane antigen (PSMA), human epidermal growth factor receptor 2 (HER2), epidermal growth factor receptor (EGFR), and vascular endothelial growth factor receptor (VEGFR). The tumor antigen can, for example, be mesothelin, preferably human mesothelin.

[0026] In certain embodiments, the antigen binding fragment comprises a Fab, a Fab', a F(ab')₂, an Fv, a single-chain variable fragment (scFv), a minibody, a diabody, a single-domain antibody (sdAb), a light chain variable domain (VL), or a variable domain (V_HH) of a camelid antibody.

The antigen binding fragment can, for example, comprise:

- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:

- a. SEQ ID NOs:34, 102, and 170, respectively;
- b. SEQ ID NOs:54, 122, and 190, respectively;
- c. SEQ ID NOs:55, 123, and 191, respectively;
- d. SEQ ID NOs:61, 129, and 197, respectively;
- e. SEQ ID NOs:31, 99, and 167, respectively;

- f. SEQ ID NOs:32, 100, and 168, respectively;
- g. SEQ ID NOs:33, 101, and 169, respectively;
- h. SEQ ID NOs:35, 103, and 171, respectively;
- i. SEQ ID NOs:36, 104, and 172, respectively;
- 5 j. SEQ ID NOs:37, 105, and 173, respectively;
- k. SEQ ID NOs:38, 106, and 174, respectively;
- l. SEQ ID NOs:39, 107, and 175, respectively;
- m. SEQ ID NOs:40, 108, and 176, respectively;
- n. SEQ ID NOs:41, 109, and 177, respectively;
- 10 o. SEQ ID NOs:42, 110, and 178, respectively;
- p. SEQ ID NOs:43, 111, and 179, respectively;
- q. SEQ ID NOs:44, 112, and 180, respectively;
- r. SEQ ID NOs:45, 113, and 181, respectively;
- s. SEQ ID NOs:46, 114, and 182, respectively;
- 15 t. SEQ ID NOs:47, 115, and 183, respectively;
- u. SEQ ID NOs:48, 116, and 184, respectively;
- v. SEQ ID NOs:49, 117, and 185, respectively;
- w. SEQ ID NOs:50, 118, and 186, respectively;
- x. SEQ ID NOs:51, 119, and 187, respectively;
- 20 y. SEQ ID NOs:52, 120, and 188, respectively;
- z. SEQ ID NOs:53, 121, and 189, respectively;
- aa. SEQ ID NOs:56, 124, and 192, respectively;
- bb. SEQ ID NOs:57, 125, and 193, respectively;
- cc. SEQ ID NOs:58, 126, and 194, respectively;
- 25 dd. SEQ ID NOs:59, 127, and 195, respectively;
- ee. SEQ ID NOs:60, 128, and 196, respectively;
- ff. SEQ ID NOs:62, 130, and 198, respectively;
- gg. SEQ ID NOs:63, 131, and 199, respectively;
- hh. SEQ ID NOs:64, 132, and 200, respectively;
- 30 ii. SEQ ID NOs:65, 133, and 201, respectively;
- jj. SEQ ID NOs:66, 134, and 202, respectively;
- kk. SEQ ID NOs:67, 135, and 203, respectively; or
- ll. SEQ ID NOs:68, 136, and 204, respectively; or

- ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:
- a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 - b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 - c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 - d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
 - e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
 - f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 - g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 - h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 - i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
 - j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 - k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 - l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 - m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 - n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
 - o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively;
- or a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid substitutions in the CDR regions.
- [0027]** In certain embodiments, the antigen binding fragment comprises:
- i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions; or
 - ii. the single chain variable fragment comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.
- [0028]** In certain embodiments, the extracellular domain comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:348-357 or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.

- [0029] Also provided are isolated polynucleotides comprising a nucleotide sequence encoding a chimeric antigen receptor (CAR). The CAR can, for example, comprise (a) an extracellular domain comprising an antigen binding fragment that binds specifically to mesothelin, preferably human mesothelin; (b) a transmembrane domain; and (c) an intracellular signaling domain. The CAR can optionally further comprise a signal peptide at the amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain. The antigen binding fragment can, for example, comprise
- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;
 - f. SEQ ID NOs:32, 100, and 168, respectively;
 - g. SEQ ID NOs:33, 101, and 169, respectively;
 - h. SEQ ID NOs:35, 103, and 171, respectively;
 - i. SEQ ID NOs:36, 104, and 172, respectively;
 - j. SEQ ID NOs:37, 105, and 173, respectively;
 - k. SEQ ID NOs:38, 106, and 174, respectively;
 - l. SEQ ID NOs:39, 107, and 175, respectively;
 - m. SEQ ID NOs:40, 108, and 176, respectively;
 - n. SEQ ID NOs:41, 109, and 177, respectively;
 - o. SEQ ID NOs:42, 110, and 178, respectively;
 - p. SEQ ID NOs:43, 111, and 179, respectively;
 - q. SEQ ID NOs:44, 112, and 180, respectively;
 - r. SEQ ID NOs:45, 113, and 181, respectively;
 - s. SEQ ID NOs:46, 114, and 182, respectively;
 - t. SEQ ID NOs:47, 115, and 183, respectively;
 - u. SEQ ID NOs:48, 116, and 184, respectively;
 - v. SEQ ID NOs:49, 117, and 185, respectively;
 - w. SEQ ID NOs:50, 118, and 186, respectively;
 - x. SEQ ID NOs:51, 119, and 187, respectively;
 - y. SEQ ID NOs:52, 120, and 188, respectively;

- z. SEQ ID NOs:53, 121, and 189, respectively;
 aa. SEQ ID NOs:56, 124, and 192, respectively;
 bb. SEQ ID NOs:57, 125, and 193, respectively;
 cc. SEQ ID NOs:58, 126, and 194, respectively;
 5 dd. SEQ ID NOs:59, 127, and 195, respectively;
 ee. SEQ ID NOs:60, 128, and 196, respectively;
 ff. SEQ ID NOs:62, 130, and 198, respectively;
 gg. SEQ ID NOs:63, 131, and 199, respectively;
 hh. SEQ ID NOs:64, 132, and 200, respectively;
 10 ii. SEQ ID NOs:65, 133, and 201, respectively;
 jj. SEQ ID NOs:66, 134, and 202, respectively;
 kk. SEQ ID NOs:67, 135, and 203, respectively; or
 ll. SEQ ID NOs:68, 136, and 204, respectively; or
 15 ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity
 determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity
 determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide
 sequences of:
 a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 20 c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
 e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
 f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 25 h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
 j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 30 m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
 o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively,
 or a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid
 substitutions in the CDR regions.

[0030] In certain embodiments, the antigen binding fragment comprises:

- i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and 420-428, or a variant thereof, preferably the variant comprises one, two or three amino acid substitutions, deletions or insertions, or
- ii. the single chain variable fragment comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220, a variant thereof, preferably the variant comprises one, two or three amino acid substitutions, deletions or insertions.

[0031] In certain embodiments, the polynucleotide further comprises a second nucleotide sequence encoding a second chimeric antigen receptor (CAR), wherein the second CAR comprises:

(a) an extracellular domain comprising a polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR);

(b) a transmembrane domain; and

(c) an intracellular signaling domain,

wherein the second CAR optionally further comprises a signal peptide at the amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain.

[0032] Preferably, the nucleotide sequence encoding the CAR is connected to the second nucleotide sequence via a 2A peptide coding sequence.

[0033] The polypeptide that binds specifically to the FSHR can, for example, comprise an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331.

[0034] In certain embodiments, the CAR comprises a signal peptide having an amino acid sequence that is at least 90% identical to SEQ ID NO:340. In certain embodiments, the CAR comprises a hinge region having an amino acid sequence that is at least 90% identical to SEQ ID NO:341.

[0035] In certain embodiments, the CAR comprises a transmembrane domain selected from the group consisting of a CD8 α transmembrane domain, a CD28 transmembrane domain, a CD4 transmembrane domain, a CD3 ζ transmembrane domain, a CD2 transmembrane domain, a 4-1BB transmembrane domain, an OX40 transmembrane domain, an ICOS transmembrane domain, a CTLA-4 transmembrane domain, a PD-1 transmembrane domain, a LAG-3 transmembrane domain, a 2B4 transmembrane domain, a BTLA transmembrane domain, and a GMCSFR transmembrane domain.

[0036] In certain embodiments, the CAR comprises an intracellular signaling domain selected from the group consisting of a signaling domain of CD3 ζ , FcR γ , FcR β , CD3 γ , CD3 δ , CD3 ϵ , CD5, CD22, CD79 α , CD79 β , and CD66 δ .

[0037] In certain embodiments, the CAR comprises a co-stimulatory domain selected from the group consisting of a co-stimulatory domain of one or more of CD28, 4-1BB (CD137), CD27, OX40, CD27, CD40, PD-1, ICOS, lymphocyte function-associated antigen-1 (LFA-1), CD2, CD7, LIGHT, NKG2C, B7-H3, TNFRSF9, TNFRSF4, TNFRSF8, CD40LG, ITGB2, KLRC2, TNFRSF18, TNFRSF14, HAVCR1, LGALS9, CD83, and a ligand that specifically binds with CD83.

[0038] In certain embodiments, an isolated polynucleotide comprises a nucleotide sequence encoding a CAR comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:370-379 and SEQ ID NOs: 448-450.

[0039] In certain embodiments, an isolated polynucleotide comprises a nucleotide sequence encoding an amino acid sequence selected from the group consisting of SEQ ID NOs:380-389 and SEQ ID NOs:451-453.

[0040] In certain embodiments, an isolated polynucleotide comprises a nucleotide sequence encoding a CAR comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:358-367 and SEQ ID NOs:445-447.

[0041] In certain embodiments, the nucleotide sequence encoding the CAR further comprises a third nucleotide sequence encoding a dominant negative form of an inhibitor of a cell-mediated immune response of the immune cell. The inhibitor of a cell-mediated immune response of the immune cell, can, for example, be a transforming growth factor β (TGF- β) receptor. The dominant negative form of the inhibitor can, for example, comprise the amino acid sequence of SEQ ID NO:347. In certain embodiments, the nucleotide sequence encoding the CAR is connected to the third nucleotide sequence via a 2A peptide coding sequence.

[0042] In certain embodiments, an isolated polynucleotide comprises a nucleotide sequence encoding an amino acid sequence selected from the group consisting of SEQ ID NOs:390-419 and SEQ ID NOs:460-468.

[0043] Also provided are vectors comprising the polynucleotides of the invention.

[0044] Also provided are host cells comprising the polynucleotides of the invention or the vectors of the invention.

[0045] Also provided are engineered immune cells expressing a CAR encoded by a polynucleotide of the invention. The engineered immune cell can, for example, be selected from

the group consisting of a cytotoxic T cell, a helper T cell, a natural killer T cell, a $\gamma\delta$ T cell, and a NK cell.

[0046] Also provided are pharmaceutical compositions. The pharmaceutical compositions can comprise a polynucleotide of the invention, a vector of the invention, a host cell of the invention, and/or an engineered immune cell of the invention and a pharmaceutically acceptable carrier.

[0047] Also provided are methods of treating a cancer in a subject in need thereof. The methods can, for example, comprise to the subject a therapeutically effective amount of the host cells of the invention. The methods can, for example, comprise administering to the subject a therapeutically effective amount of the pharmaceutical composition of the invention. In certain embodiments, the cancer is selected from the group consisting of an ovarian cancer, primary peritoneal carcinomas, pancreatic ductal adenocarcinoma (PDA), malignant pleural mesothelioma (MPM), lung adenocarcinoma, triple negative breast cancer, endometrial cancer, biliary cancer, gastric cancer, and pediatric acute myeloid leukemia.

[0048] Also provided are methods of engineering an immune cell. The methods comprise introducing into the immune cell a polynucleotide of the invention, wherein the polynucleotide is operably linked to a promoter.

[0049] Also provided are methods of producing a pharmaceutical composition. The methods comprise combining a polynucleotide of the invention, a vector of the invention, a host cell of the invention, and/or an engineered immune cell of the invention with a pharmaceutically acceptable carrier to obtain the pharmaceutical composition.

[0050] Also provided are systems for inducing the activity of an immune cell and/or a target cell. The systems can, for example, comprise a chimeric antigen receptor (CAR) of the invention.

[0051] Also provided are isolated antibodies or antigen binding fragments that specifically bind mesothelin, preferably human mesothelin. The isolated antibodies or antigen binding fragments can, for example, be selected from the group consisting of a Fab, a Fab', a F(ab')₂, an Fv, a single-chain variable fragment (scFv), a minibody, a diabody, a single-domain antibody (sdAb), a light chain variable domain (VL), and a variable domain (V_HH) of a camelid antibody.

[0052] In certain embodiments, the isolated antibody or antigen binding fragment comprises:

- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;

- e. SEQ ID NOs:31, 99, and 167, respectively;
- f. SEQ ID NOs:32, 100, and 168, respectively;
- g. SEQ ID NOs:33, 101, and 169, respectively;
- h. SEQ ID NOs:35, 103, and 171, respectively;
- 5 i. SEQ ID NOs:36, 104, and 172, respectively;
- j. SEQ ID NOs:37, 105, and 173, respectively;
- k. SEQ ID NOs:38, 106, and 174, respectively;
- l. SEQ ID NOs:39, 107, and 175, respectively;
- m. SEQ ID NOs:40, 108, and 176, respectively;
- 10 n. SEQ ID NOs:41, 109, and 177, respectively;
- o. SEQ ID NOs:42, 110, and 178, respectively;
- p. SEQ ID NOs:43, 111, and 179, respectively;
- q. SEQ ID NOs:44, 112, and 180, respectively;
- r. SEQ ID NOs:45, 113, and 181, respectively;
- 15 s. SEQ ID NOs:46, 114, and 182, respectively;
- t. SEQ ID NOs:47, 115, and 183, respectively;
- u. SEQ ID NOs:48, 116, and 184, respectively;
- v. SEQ ID NOs:49, 117, and 185, respectively;
- w. SEQ ID NOs:50, 118, and 186, respectively;
- 20 x. SEQ ID NOs:51, 119, and 187, respectively;
- y. SEQ ID NOs:52, 120, and 188, respectively;
- z. SEQ ID NOs:53, 121, and 189, respectively;
- aa. SEQ ID NOs:56, 124, and 192, respectively;
- bb. SEQ ID NOs:57, 125, and 193, respectively;
- 25 cc. SEQ ID NOs:58, 126, and 194, respectively;
- dd. SEQ ID NOs:59, 127, and 195, respectively;
- ee. SEQ ID NOs:60, 128, and 196, respectively;
- ff. SEQ ID NOs:62, 130, and 198, respectively;
- gg. SEQ ID NOs:63, 131, and 199, respectively;
- 30 hh. SEQ ID NOs:64, 132, and 200, respectively;
- ii. SEQ ID NOs:65, 133, and 201, respectively;
- jj. SEQ ID NOs:66, 134, and 202, respectively;
- kk. SEQ ID NOs:67, 135, and 203, respectively; or
- ll. SEQ ID NOs:68, 136, and 204, respectively; or

- ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:
- 5 a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 - b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 - c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 - d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
 - e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
 - 10 f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 - g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 - h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 - i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
 - j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 - 15 k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 - l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 - m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 - n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
 - o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively; or
 - 20 a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid substitutions in the CDR regions;
- wherein the isolated antibody or antigen binding fragment thereof specifically binds mesothelin, preferably human mesothelin.
- [0053]** In certain embodiments, the antibody or antigen binding fragment comprises:
- 25 i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and 420-428, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions; or
 - ii. the single chain variable fragment comprising an amino acid sequence at least 95%
 - 30 identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.
- [0054]** In certain embodiments, the antibody or antigen binding fragment thereof is chimeric.
- In certain embodiments, the antibody or antigen binding fragment thereof is human or humanized.

[0055] Also provided are isolated nucleic acids encoding the isolated antibody or antigen binding fragment thereof of the invention. Also provided are vectors comprising the isolated nucleic acids of the invention. Also provided are host cells comprising the isolated nucleic acids and/or the vectors of the invention.

5 [0056] Also provided are pharmaceutical compositions comprising the isolated antibody or antigen binding fragment thereof of the invention and a pharmaceutically acceptable carrier.

[0057] Also provided are methods of treating a cancer in a subject in need thereof. The methods comprise administering to the subject a pharmaceutical composition comprising the isolated antibody or antigen binding fragment thereof of the invention and a pharmaceutically acceptable carrier.

10 [0058] Also provided are methods of producing the antibody or antigen binding fragment thereof of the invention. The methods comprise culturing a cell comprising a nucleic acid encoding the antibody or antigen binding fragment thereof under conditions to produce the antibody or antigen binding fragment thereof, and recovering the antibody or antigen binding fragment thereof from the cell or culture.

15 [0059] Also provided are methods of producing a pharmaceutical composition comprising the antibody or antigen binding fragment thereof of the invention. The methods comprise combining the antibody or antigen binding fragment thereof with a pharmaceutically acceptable carrier to obtain the pharmaceutical composition.

20

BRIEF DESCRIPTION OF THE DRAWINGS

[0060] The foregoing summary, as well as the following detailed description of preferred embodiments of the present application, will be better understood when read in conjunction with the appended drawings. It should be understood, however, that the application is not limited to the precise embodiments shown in the drawings.

25 [0061] FIG. 1A is a schematic representation of an anti-mesothelin CAR construct; and FIG. 1B illustrates the CAR construct anchored in T cell membrane.

[0062] FIG. 2A is a schematic representation of an FSHR TCR construct; and FIG. 2B illustrates the TCR construct anchored in T cell membrane.

30 [0063] FIGS. 3A-3D show schematic representations of embodiments of FSHR/mesothelin tandem CAR constructs and illustrations of the constructs anchored in T cell membrane.

[0064] FIGS. 4A-4B show schematic representations of a mesothelin/FSHR dual CAR construct and an illustration of the construct anchored in T cell membrane.

[0065] FIGS. 5A-5B show schematic representations of a mesothelin/FSHR CAR/TCR construct and an illustration of the construct anchored in T cell membrane.

[0066] FIGS. 6A-6L show schematic representations of a dnTGF β RII armored CAR and/or TCR constructs according to embodiments of the application and illustrations of the constructs anchored in T cell membrane.

[0067] FIGS. 7-8 are graphs demonstrating anti-mesothelin CAR-T according to embodiments of the invention induced killing against OVCAR-8 cells. In each figure, the results for the CARs are depicted in the order as in the legend shown on the right.

[0068] FIGS. 9-10 are graphs showing the level of IFN γ in the supernatant of T cells transduced with various CAR constructs according to embodiments of the application. In each figure, the results for the CARs are depicted in the order as in the legend shown on the right.

[0069] FIG. 11 shows a graph demonstrating long-term expansion of anti-mesothelin CAR-T according to embodiments of the application by repetitive stimulation.

[0070] FIG. 12 shows a graph demonstrating anti-tumor efficacy of anti-mesothelin CAR-T according to embodiments of the application in OVCAR-8 xenograft model.

[0071] FIG. 13 shows the expression of FSHR on ovarian cancer cell lines via flow cytometric assay.

[0072] FIG. 14 shows a graph demonstrating FSHR/mesothelin tandem CAR-T according to embodiments of the invention induced killing against OVCAR-8 cells. In the figure, the results for the CARs are depicted in the order as in the legend shown on the right.

[0073] FIG. 15 shows a graph demonstrating mesothelin/FSHR dual CAR-T and mesothelin/FSHR CAR/TCR-T according to embodiments of the application induced killing against OVCAR-8 cells. In the figure, the results for the CARs are depicted in the order as in the legend shown on the right.

[0074] FIGS. 16-17 show graphs demonstrating dnTGF β RII armored CAR-T and naked CAR-T according to embodiments of the application induced killing against OVCAR-8 cells. In each figure, the results for the CARs are depicted in the order as in the legend shown on the right.

[0075] FIGS. 18-19 show graphs demonstrating detected IFN γ and TNF α release level upon administration of CAR and/or TCR constructs according to embodiments of the application. In each figure, the results for the CARs are depicted in the order as in the legend shown on the right.

[0076] FIGS. 20-21 show graphs demonstrating anti-tumor efficacy of anti-mesothelin CAR-T and mesothlin/FSHR dual CAR-T according to embodiments of the application in OVCAR-8 xenograft model.

[0077] FIG. 22 shows a graph demonstrating anti-tumor efficacy of dnTGF β RII armored CAR-T and naked CAR-T according to embodiments of the application in OVCAR-8 xenograft model

DETAILED DESCRIPTION OF THE INVENTION

[0078] Various publications, articles and patents are cited or described in the background and throughout the specification; each of these references is herein incorporated by reference in its entirety. Discussion of documents, acts, materials, devices, articles or the like which has been included in the present specification is for the purpose of providing context for the invention. Such discussion is not an admission that any or all of these matters form part of the prior art with respect to any inventions disclosed or claimed.

[0079] Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood to one of ordinary skill in the art to which this invention pertains. Otherwise, certain terms used herein have the meanings as set forth in the specification.

[0080] It must be noted that as used herein and in the appended claims, the singular forms “a,” “an,” and “the” include plural reference unless the context clearly dictates otherwise.

[0081] Unless otherwise stated, any numerical values, such as a concentration or a concentration range described herein, are to be understood as being modified in all instances by the term “about.” Thus, a numerical value typically includes $\pm 10\%$ of the recited value. For example, a concentration of 1 mg/mL includes 0.9 mg/mL to 1.1 mg/mL. Likewise, a concentration range of 1% to 10% (w/v) includes 0.9% (w/v) to 11% (w/v). As used herein, the use of a numerical range expressly includes all possible subranges, all individual numerical values within that range, including integers within such ranges and fractions of the values unless the context clearly indicates otherwise.

[0082] Unless otherwise indicated, the term “at least” preceding a series of elements is to be understood to refer to every element in the series. Those skilled in the art will recognize or be able to ascertain using no more than routine experimentation, many equivalents to the specific embodiments of the invention described herein. Such equivalents are intended to be encompassed by the invention.

[0083] As used herein, the terms “comprises,” “comprising,” “includes,” “including,” “has,” “having,” “contains” or “containing,” or any other variation thereof, will be understood to imply the inclusion of a stated integer or group of integers but not the exclusion of any other integer or

group of integers and are intended to be non-exclusive or open-ended. For example, a composition, a mixture, a process, a method, an article, or an apparatus that comprises a list of elements is not necessarily limited to only those elements but can include other elements not expressly listed or inherent to such composition, mixture, process, method, article, or apparatus.

- 5 Further, unless expressly stated to the contrary, “or” refers to an inclusive or and not to an exclusive or. For example, a condition A or B is satisfied by any one of the following: A is true (or present) and B is false (or not present), A is false (or not present) and B is true (or present), and both A and B are true (or present).

- [0084] As used herein, the conjunctive term “and/or” between multiple recited elements is understood as encompassing both individual and combined options. For instance, where two
10 elements are conjoined by “and/or,” a first option refers to the applicability of the first element without the second. A second option refers to the applicability of the second element without the first. A third option refers to the applicability of the first and second elements together. Any one of these options is understood to fall within the meaning, and therefore satisfy the
15 requirement of the term “and/or” as used herein. Concurrent applicability of more than one of the options is also understood to fall within the meaning, and therefore satisfy the requirement of the term “and/or.”

- [0085] As used herein, the term “consists of,” or variations such as “consist of” or “consisting of,” as used throughout the specification and claims, indicate the inclusion of any recited integer
20 or group of integers, but that no additional integer or group of integers can be added to the specified method, structure, or composition.

- [0086] As used herein, the term “consists essentially of,” or variations such as “consist essentially of” or “consisting essentially of,” as used throughout the specification and claims, indicate the inclusion of any recited integer or group of integers, and the optional inclusion of any
25 recited integer or group of integers that do not materially change the basic or novel properties of the specified method, structure or composition. See M.P.E.P. § 2111.03.

- [0087] As used herein, “subject” means any animal, preferably a mammal, most preferably a human. The term “mammal” as used herein, encompasses any mammal. Examples of mammals include, but are not limited to, cows, horses, sheep, pigs, cats, dogs, mice, rats, rabbits,
30 guinea pigs, monkeys, humans, etc., more preferably a human.

[0088] It should also be understood that the terms “about,” “approximately,” “generally,” “substantially,” and like terms, used herein when referring to a dimension or characteristic of a component of the preferred invention, indicate that the described dimension/characteristic is not a strict boundary or parameter and does not exclude minor variations therefrom that are

functionally the same or similar, as would be understood by one having ordinary skill in the art. At a minimum, such references that include a numerical parameter would include variations that, using mathematical and industrial principles accepted in the art (e.g., rounding, measurement or other systematic errors, manufacturing tolerances, etc.), would not vary the least significant digit.

5 **[0089]** The terms “identical” or percent “identity,” in the context of two or more nucleic acids or polypeptide sequences (e.g., CAR polypeptides and the CAR polynucleotides encoding them; anti-mesothelin antibody and antigen binding fragments thereof and the polynucleotides that encode them; FSHR peptides and the polynucleotides that encode them; dnTGF β R2 peptides and the polynucleotides that encode them), refer to two or more
10 sequences or subsequences that are the same or have a specified percentage of amino acid residues or nucleotides that are the same, when compared and aligned for maximum correspondence, as measured using one of the following sequence comparison algorithms or by visual inspection.

[0090] For sequence comparison, typically one sequence acts as a reference sequence, to
15 which test sequences are compared. When using a sequence comparison algorithm, test and reference sequences are input into a computer, subsequence coordinates are designated, if necessary, and sequence algorithm program parameters are designated. The sequence comparison algorithm then calculates the percent sequence identity for the test sequence(s) relative to the reference sequence, based on the designated program parameters.

20 **[0091]** Optimal alignment of sequences for comparison can be conducted, e.g., by the local homology algorithm of Smith & Waterman, *Adv. Appl. Math.* 2:482 (1981), by the homology alignment algorithm of Needleman & Wunsch, *J. Mol. Biol.* 48:443 (1970), by the search for similarity method of Pearson & Lipman, *Proc. Nat’l. Acad. Sci. USA* 85:2444 (1988), by computerized implementations of these algorithms (GAP, BESTFIT, FASTA, and TFASTA in
25 the Wisconsin Genetics Software Package, Genetics Computer Group, 575 Science Dr., Madison, WI), or by visual inspection (*see generally, Current Protocols in Molecular Biology*, F.M. Ausubel *et al.*, eds., Current Protocols, a joint venture between Greene Publishing Associates, Inc. and John Wiley & Sons, Inc., (1995 Supplement) (Ausubel)).

[0092] Examples of algorithms that are suitable for determining percent sequence identity and
30 sequence similarity are the BLAST and BLAST 2.0 algorithms, which are described in Altschul *et al.* (1990) *J. Mol. Biol.* 215: 403-410 and Altschul *et al.* (1997) *Nucleic Acids Res.* 25: 3389-3402, respectively. Software for performing BLAST analyses is publicly available through the National Center for Biotechnology Information. This algorithm involves first identifying high scoring sequence pairs (HSPs) by identifying short words of length W in the query sequence,

which either match or satisfy some positive-valued threshold score T when aligned with a word of the same length in a database sequence. T is referred to as the neighborhood word score threshold (Altschul *et al.*, *supra*). These initial neighborhood word hits act as seeds for initiating searches to find longer HSPs containing them. The word hits are then extended in both
5 directions along each sequence for as far as the cumulative alignment score can be increased.

[0093] Cumulative scores are calculated using, for nucleotide sequences, the parameters M (reward score for a pair of matching residues; always > 0) and N (penalty score for mismatching residues; always < 0). For amino acid sequences, a scoring matrix is used to calculate the cumulative score. Extension of the word hits in each direction are halted when: the cumulative
10 alignment score falls off by the quantity X from its maximum achieved value; the cumulative score goes to zero or below, due to the accumulation of one or more negative-scoring residue alignments; or the end of either sequence is reached. The BLAST algorithm parameters W, T, and X determine the sensitivity and speed of the alignment. The BLASTN program (for nucleotide sequences) uses as defaults a wordlength (W) of 11, an expectation (E) of 10, M=5,
15 N= -4, and a comparison of both strands. For amino acid sequences, the BLASTP program uses as defaults a wordlength (W) of 3, an expectation (E) of 10, and the BLOSUM62 scoring matrix (see Henikoff & Henikoff, *Proc. Natl. Acad. Sci. USA* 89:10915 (1989)).

[0094] In addition to calculating percent sequence identity, the BLAST algorithm also performs a statistical analysis of the similarity between two sequences (see, *e.g.*, Karlin &
20 Altschul, *Proc. Nat'l. Acad. Sci. USA* 90:5873-5787 (1993)). One measure of similarity provided by the BLAST algorithm is the smallest sum probability (P(N)), which provides an indication of the probability by which a match between two nucleotide or amino acid sequences would occur by chance. For example, a nucleic acid is considered similar to a reference sequence if the smallest sum probability in a comparison of the test nucleic acid to the reference nucleic
25 acid is less than about 0.1, more preferably less than about 0.01, and most preferably less than about 0.001.

[0095] A further indication that two nucleic acid sequences or polypeptides are substantially identical is that the polypeptide encoded by the first nucleic acid is immunologically cross
30 reactive with the polypeptide encoded by the second nucleic acid, as described below. Thus, a polypeptide is typically substantially identical to a second polypeptide, for example, where the two peptides differ only by conservative substitutions. Another indication that two nucleic acid sequences are substantially identical is that the two molecules hybridize to each other under stringent conditions.

[0096] As used herein, the term “isolated” means a biological component (such as a nucleic acid, peptide or protein) has been substantially separated, produced apart from, or purified away from other biological components of the organism in which the component naturally occurs, i.e., other chromosomal and extrachromosomal DNA and RNA, and proteins. Nucleic acids, peptides and proteins that have been “isolated” thus include nucleic acids and proteins purified by standard purification methods. “Isolated” nucleic acids, peptides and proteins can be part of a composition and still be isolated if the composition is not part of the native environment of the nucleic acid, peptide, or protein. The term also embraces nucleic acids, peptides and proteins prepared by recombinant expression in a host cell as well as chemically synthesized nucleic acids.

[0097] As used herein, the term “polynucleotide,” synonymously referred to as “nucleic acid molecule,” “nucleotides” or “nucleic acids,” refers to any polyribonucleotide or polydeoxyribonucleotide, which can be unmodified RNA or DNA or modified RNA or DNA. “Polynucleotides” include, without limitation single- and double-stranded DNA, DNA that is a mixture of single- and double-stranded regions, single- and double-stranded RNA, and RNA that is mixture of single- and double-stranded regions, hybrid molecules comprising DNA and RNA that can be single-stranded or, more typically, double-stranded or a mixture of single- and double-stranded regions. In addition, “polynucleotide” refers to triple-stranded regions comprising RNA or DNA or both RNA and DNA. The term polynucleotide also includes DNAs or RNAs containing one or more modified bases and DNAs or RNAs with backbones modified for stability or for other reasons. “Modified” bases include, for example, tritylated bases and unusual bases such as inosine. A variety of modifications can be made to DNA and RNA; thus, “polynucleotide” embraces chemically, enzymatically or metabolically modified forms of polynucleotides as typically found in nature, as well as the chemical forms of DNA and RNA characteristic of viruses and cells. “Polynucleotide” also embraces relatively short nucleic acid chains, often referred to as oligonucleotides.

[0098] As used herein, the term “vector” is a replicon in which another nucleic acid segment can be operably inserted so as to bring about the replication or expression of the segment.

[0099] As used herein, the term “host cell” refers to a cell comprising a nucleic acid molecule of the invention. The “host cell” can be any type of cell, e.g., a primary cell, a cell in culture, or a cell from a cell line. In one embodiment, a “host cell” is a cell transfected with a nucleic acid molecule of the invention. In another embodiment, a “host cell” is a progeny or potential progeny of such a transfected cell. A progeny of a cell may or may not be identical to the parent cell, e.g., due to mutations or environmental influences that can occur in succeeding generations or integration of the nucleic acid molecule into the host cell genome.

[00100] The term “expression” as used herein, refers to the biosynthesis of a gene product. The term encompasses the transcription of a gene into RNA. The term also encompasses translation of RNA into one or more polypeptides, and further encompasses all naturally occurring post-transcriptional and post-translational modifications. The expressed CAR can be within the cytoplasm of a host cell, into the extracellular milieu such as the growth medium of a cell culture, or anchored to the cell membrane.

[00101] As used herein, the term “immune cell” or “immune effector cell” refers to a cell that is involved in an immune response, e.g., in the promotion of an immune effector response. Examples of immune cells include T cells, B cells, natural killer (NK) cells, mast cells, and myeloid-derived phagocytes. According to particular embodiments, the engineered immune cells are T cells, and are referred to as CAR-T cells because they are engineered to express CARs of the invention.

[00102] As used herein, the term “engineered immune cell” refers to an immune cell, also referred to as an immune effector cell, which has been genetically modified by the addition of extra genetic material in the form of DNA or RNA to the total genetic material of the cell. According to embodiments herein, the engineered immune cells have been genetically modified to express a CAR construct according to the invention.

[00103] As used herein, the term “signal peptide” refers to a leader sequence at the amino-terminus (N-terminus) of a nascent protein, which co-translationally or post-translationally directs the nascent protein to the endoplasmic reticulum and subsequent surface expression.

[00104] As used herein, the term “extracellular antigen binding domain,” “extracellular domain,” or “extracellular ligand binding domain” refers to the part of a protein that is located outside of the cell membrane and is capable of binding to an antigen, target or ligand.

[00105] As used herein, the term “hinge region” refers to the part of a protein that connects two adjacent domains of the protein, e.g., the extracellular domain and the transmembrane domain.

[00106] As used herein, the term “transmembrane domain” refers to the portion of a protein that extends across the cell membrane and anchors the protein to cell membrane.

[00107] T Cell Receptors (TCRs) Complex and Chimeric Antigen Receptors (CARs)

[00108] TCRs are disulfide-linked membrane anchored heterodimeric proteins, typically comprising highly variable alpha (α) and beta (β) chains expressed as a complex with invariant CD3 chain molecules. T cells expressing these type of TCRs are referred to as $\alpha\beta$ (or $\alpha\beta$) T cells. A minority of T cells express an alternative TCR comprising variable gamma (γ) and delta (δ) chains and are referred to as $\gamma\delta$ T cells. TCR is not able to mediate signal transduction itself due to its short cytoplasmic tail, so TCR still requires CD3 and zeta to carry out the signal

transduction in its place. A TCR receptor complex is an octomeric complex of variable TCR receptor α and β chains with three dimeric signaling modules CD3 δ/ϵ , CD3 γ/ϵ and CD247 ζ/ζ or ζ/η .

5 [00109] According to embodiments of the application, suitable TCRs bind specifically to a major histocompatibility complex (MHC) on the surface of cancer cells that displays a peptide fragment of a tumor antigen. An MHC is a set of cell-surface proteins which allow the acquired immune system to recognize 'foreign' molecules. Proteins are intracellularly degraded and presented on the surface of cells by the MHC. MHCs displaying "foreign" peptides, such a viral or cancer associated peptides, are recognized by T cells with the appropriate TCRs, prompting
10 cell destruction pathways. MHCs on the surface of cancer cells can display peptide fragments of tumor antigen i.e. an antigen which is present on a cancer cell but not the corresponding non-cancerous cell. T cells which recognize these peptide fragments can exert a cytotoxic effect on the cancer cell.

[00110] For example, the T cells can be modified to express a heterologous TCR that binds
15 specifically to MHCs displaying peptide fragments of a tumor antigen expressed by the cancer cells in a specific cancer patient. Tumor antigens expressed by cancer cells in the cancer patient may identified using standard techniques. According to an embodiment of the invention, the heterologous TCR binds specifically to FSHR. For example, a polypeptide, such as an FSH fragment, which binds specifically to an FSHR, is fused to CD3 epsilon, CD3 gamma or CD3
20 delta chain. The fusion protein forms a TCR complex on T cells through the interaction of CD3 with TCR α/β chains. The TCR complex binds specifically to FSHR on tumor cells via the FSH fragment, and the binding initiates TCR signaling against the tumor cells. According to yet another embodiment of the invention, the heterologous TCR is expressed together with a CAR that binds specifically to mesothelin. Heterologous TCRs can include $\alpha\beta$ TCR heterodimers.

25 [00111] The TCR can be engineered to increase its affinity or avidity for a tumor antigen (i.e. an affinity enhanced TCR). The affinity enhanced TCR can comprise one or more mutations relative to a naturally occurring TCR, for example, one or more mutations in the hypervariable complementarity determining regions (CDRs) of the variable regions of the TCR α and β chains. These mutations increase the affinity of the TCR for MHCs that display a peptide fragment of a
30 tumor antigen expressed by cancer cells. Suitable methods of generated affinity enhanced TCRs include screening libraries of TCR mutants using phage or yeast display and are well known in the art (see for example Robbins et al J Immunol (2008) 180(9):6116; San Miguel et al (2015) Cancer Cell 28 (3) 281-283; Schmitt et al (2013) Blood 122 348-256; Jiang et al (2015) Cancer Discovery 5 901).

[00112] Expression of a heterologous antigen receptor, such as a heterologous TCR or CAR, can alter the immunogenic specificity of the T cells so that they recognize or display improved recognition for one or more tumor antigens that are present on the surface of the cancer cells of an individual with cancer.

5 [00113] In some embodiments, the T cells can display reduced binding or no binding to cancer cells in the absence of the heterologous antigen receptor. For example, expression of the heterologous antigen receptor (such as the engineered CAR and/or TCR) can increase the affinity and/or specificity of the cancer cell binding of modified T cells relative to unmodified T cells.

10 [00114] In some embodiments, the coding sequences for the individual components of the CAR and/or TCR (e.g. scFv or sdAb, FSH fragment, CD3 epsilon, CD3 gamma or CD3 delta chain, or TCR α and TCR β chains) can be separated by a sequence encoding a cleavage recognition sequence. This allows the components of the construct to be expressed as a single fusion which undergoes intracellular cleavage to generate the two or more separate proteins. Suitable cleavage recognition sequences are well known in the art and include, but are not limited to, 2A-furin
15 sequence, e.g., P2A.

[00115] The term “heterologous” refers to a polypeptide or nucleic acid that is foreign to a particular biological system, such as a host cell, and is not naturally present in that system. A heterologous polypeptide or nucleic acid can be introduced to a biological system by artificial means, for example using recombinant techniques. For example, heterologous nucleic acid
20 encoding a polypeptide can be inserted into a suitable expression construct which is in turn used to transform a host cell to produce the polypeptide. A heterologous polypeptide or nucleic acid can be synthetic or artificial or may exist in a different biological system, such as a different species or cell type. An endogenous polypeptide or nucleic acid is native to a particular biological system, such as a host cell, and is naturally present in that system. A recombinant polypeptide is
25 expressed from heterologous nucleic acid that has been introduced into a cell by artificial means, for example using recombinant techniques. A recombinant polypeptide can be identical to a polypeptide that is naturally present in the cell or can be different from the polypeptides that are naturally present in that cell.

[00116] In one general aspect, provided is an isolated polynucleotide comprising a nucleotide
30 sequence encoding a protein of a modified T cell receptor (TCR) complex. The protein comprises, from the N-terminus to the C-terminus, an optional signal peptide, a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR), and an extracellular domain, a transmembrane domain and an intracellular domain of a CD3 polypeptide selected from the group consisting of a CD3- γ , CD3- δ and CD3- ϵ chain.

[00117] In certain embodiments, the protein contains a signal peptide comprising an amino acid sequence selected from the group consisting of an amino acid sequence at least 90% identical to SEQ ID NOs: 430 to 432, respectively; a first polypeptide that binds specifically to FSHR comprising an amino acid sequence selected from the group consisting of an amino acid sequence at least 90% identical to SEQ ID NOs:319-331, respectively; an extracellular domain comprising an amino acid sequence selected from the group consisting of an amino acid sequence at least 90% identical to SEQ ID NOs: 433 to 435, respectively; a transmembrane domain comprising an amino acid sequence selected from the group consisting of an amino acid sequence at least 90% identical to SEQ ID NOs: 436 to 438, respectively; and an intracellular domain comprising an amino acid sequence selected from the group consisting of an amino acid sequence at least 90% identical to SEQ ID NOs: 439 to 441, respectively.

[00118] In certain embodiments, the protein contains a signal peptide comprising an amino acid sequence selected from the group consisting of SEQ ID NOs: 430 to 432; a first polypeptide that binds specifically to FSHR comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331; an extracellular domain comprising an amino acid sequence selected from the group consisting of SEQ ID NOs: 433 to 435, respectively; a transmembrane domain comprising an amino acid sequence selected from the group consisting of SEQ ID NOs: 436 to 438, respectively; and an intracellular domain comprising an amino acid sequence selected from the group consisting of SEQ ID NOs: 439 to 441, respectively.

[00119] In certain embodiments, an isolated polynucleotide comprises a nucleotide sequence encoding a protein of a modified TCR complex comprising the amino acid sequence of SEQ ID NO: 442-444, or a variant thereof. Preferably, the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.

[00120] In certain embodiments, the isolated polynucleotide comprising the nucleotide sequence encoding a protein of a modified TCR further comprises a third nucleotide sequence encoding a dominant negative form of an inhibitor of the cell-mediated immune response of the immune cell. The inhibitor of a cell-mediated immune response of the immune cell can, for example, be a transforming growth factor β (TGF- β) receptor (e.g., TGF β RII). In certain embodiments, the dominant negative form of the inhibitor comprises the amino acid sequence of SEQ ID NO:347. In certain embodiments, the nucleotide sequence encoding the protein of a modified TCR complex is connected to the third nucleotide sequence via a 2A peptide coding sequence.

[00121] In certain embodiments, an isolated polynucleotide comprising a nucleotide sequence encoding a protein that is subsequently cleaved to product a protein of a modified TCR and a

dominant negative form of an inhibitor of the cell-mediated immune response of the immune cell. Preferably, the protein comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:457-459.

5 [00122] In certain embodiments, the isolated polynucleotide encoding a protein of a modified TCR further comprises a second nucleotide sequence encoding a chimeric antigen receptor (CAR), wherein the CAR comprises: (a) an extracellular domain comprising an antigen binding fragment that binds specifically to a tumor antigen; (b) a transmembrane domain; and (c) an intracellular signaling domain. Preferably, the nucleotide sequence encoding the protein of a modified TCR complex is connected to the nucleotide sequence encoding a CAR via a 2A peptide
10 coding sequence.

[00123] In certain embodiments, an isolated polynucleotide comprising a nucleotide sequence encoding a protein that is subsequently cleaved to product a protein of a modified TCR and CAR. Preferably, the protein comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:454-456.

15 [00124] In certain embodiments, an isolated polynucleotide comprising a nucleotide sequence encoding a protein that is subsequently cleaved to product a protein of a modified TCR, a CAR and a dominant negative form of an inhibitor of the cell-mediated immune response of the immune cell. Preferably, the protein comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:469-471.

20 [00125] As used herein, the term “chimeric antigen receptor” (CAR) refers to an artificial receptor that is engineered recombinantly to comprise at least an extracellular domain that binds specifically to an antigen or a target, a transmembrane domain and an intracellular T cell receptor-activating signaling domain. Engagement of the extracellular domain of the CAR with the target antigen on the surface of a target cell results in clustering of the CAR and delivers an
25 activation stimulus to the CAR-containing cell. CARs redirect the specificity of immune effector cells and trigger proliferation, cytokine production, phagocytosis and/or production of molecules that can mediate cell death of the target antigen-expressing cell in a major histocompatibility (MHC)-independent manner.

[00126] A CAR can, for example, comprise an scFv or a peptide ligand fused to a TCR CD3
30 transmembrane region and endodomain. An scFv is a fusion protein of the variable regions of the heavy (V_H) and light (V_L) chains of immunoglobulins via a short linker peptide of approximately 10 to 25 amino acids (Huston J. S. et al. Proc Natl Acad Sci USA 1988; 85(16):5879-5883). The linker can be glycine-rich for flexibility, and serine or threonine rich for solubility. A linker peptide can connect the N-terminus of the V_H to the C-terminus of the V_L , or vice versa. The

- peptide ligand can be any peptide that binds specifically to a receptor of interest. The scFv or peptide ligand can be preceded by a signal peptide to direct the protein to the endoplasmic reticulum, and subsequently the T cell surface. In the CAR, the scFv or peptide ligand can be fused to a TCR transmembrane and endodomain. A flexible spacer can be included between the
- 5 scFv and the TCR transmembrane domain to allow for variable orientation and antigen binding. The endodomain is the functional signal-transmitting domain of the receptor. An endodomain of a CAR can comprise, for example, intracellular signaling domains from the CD3 ζ -chain, or from receptors such as CD28, 41BB, or ICOS. A CAR can comprise multiple signaling domains, for example, but not limited to, CD3 ζ -CD28-41BB or CD3 ζ -CD28-OX40.
- 10 **[00127]** The CAR can bind specifically to a tumor-specific antigen expressed by cancer cells. For example, the T cells can be modified to express a CAR that binds specifically to a tumor antigen that is expressed by the cancer cells in a specific cancer patient. Tumor antigens expressed by cancer cells in the cancer patient can identified using standard techniques. According to an embodiment of the invention, the CAR binds specifically to mesothelin.
- 15 According to another embodiment of the invention, the CAR binds specifically to FSHR. According to yet another embodiment of the invention, the CAR binds specifically to mesothelin and FSHR.
- [00128]** In certain general aspects, the invention relates to an isolated polynucleotide comprising a nucleotide sequence encoding a chimeric antigen receptor (CAR). The CAR
- 20 comprises:
- (a) an extracellular domain comprising a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR), and an antigen binding fragment that binds specifically to a tumor antigen;
 - (b) a transmembrane domain; and
 - 25 (c) an intracellular domain,
- wherein the CAR optionally further comprises a signal peptide at its amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain.
- [00129]** In certain embodiments, the first polypeptide that binds specifically to the FSHR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331.
- 30 In certain embodiments, the first polypeptide comprises the amino acid sequence of SEQ ID NO:319.
- [00130]** In certain embodiments, the first polypeptide is connected to the amino terminus or carboxy terminus of the antigen binding fragment via a linker. The linker can, for example, be

selected from the group consisting of a G₄S linker, a (G₄S)₂ linker, a (G₄S)₃ linker, a (G₄S)₄ linker, and a (G₄S)₅ linker.

[00131] In certain embodiments, the tumor antigen is selected from the group consisting of mesothelin, folate receptor α , mucin 16 (MUC16), prostate-specific membrane antigen (PSMA), human epidermal growth factor receptor 2 (HER2), epidermal growth factor receptor (EGFR), and vascular endothelial growth factor receptor (VEGFR). The tumor antigen can, for example, be mesothelin, preferably human mesothelin.

[00132] In certain embodiments, the antigen binding fragment is a Fab, a Fab', a F(ab')₂, an Fv, a single-chain variable fragment (scFv), a minibody, a diabody, a single-domain antibody (sdAb), a light chain variable domain (VL), or a variable domain (V_HH) of a camelid antibody.

[00133] In other general aspects, the CAR comprises:

- (a) an extracellular domain comprising an antigen binding fragment that binds specifically to mesothelin, preferably human mesothelin;
- (b) a transmembrane domain; and
- (c) an intracellular signaling domain,

wherein the CAR optionally further comprises a signal peptide at the amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain, and wherein the antigen binding fragment is (i) a single domain antibody (sdAb) or (ii) a single chain variable fragment (scFv). In certain embodiments, the CAR further comprises a polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR). The polypeptide that binds specifically to FSHR can, for example, comprise an amino acid sequence selected from the group consisting of an amino acid sequence at least 90% identical to SEQ ID NOs:319-331, respectively. In certain embodiments, the polypeptide that binds specifically to FSHR can comprise the amino acid sequence of SEQ ID NO:319.

[00134] In certain embodiments, the extracellular domain of the CAR is preceded by a signal peptide at the amino-terminus. Any suitable signal peptide can be used in the invention. The signal peptide can, for example, be derived from a natural, synthetic, semi-synthetic, or recombinant source. According to one embodiment, the signal peptide is a human CD8 α signal peptide, a human CD3 δ signal peptide, a human CD3 ζ signal peptide, a human GMCSFR signal peptide, a human 4-1BB signal peptide, or a derivative thereof. According to particular embodiments, the signal peptide is a human CD8 α signal peptide. The human CD8 α signal peptide comprises an amino acid sequence at least 90% identical to SEQ ID NO:340, preferably the amino acid sequence of SEQ ID NO:340. The signal peptide can be cleaved by a signal

peptidase during or after completion of translocation of the CAR to generate a mature CAR free of the signal peptide.

[00135] In certain embodiments, the CAR can further comprise a hinge region connecting the extracellular domain and the transmembrane domain. The hinge region functions to move the extracellular domain away from the surface of the engineered immune cell to enable proper cell/cell contact, binding to the target or antigen and activation (Patel et al., Gene Therapy 6:412-9 (1999)). Any suitable hinge region can be used in a CAR of the invention. The hinge region can be derived from a natural, synthetic, semi-synthetic, or recombinant source. According to particular embodiments, the hinge region of the CAR is a hinge region from a CD8 α peptide. In particular embodiments, the hinge region comprises an amino acid sequence at least 90% identical to SEQ ID NO:341, preferably the amino acid sequence of SEQ ID NO:341.

[00136] A CAR of the invention comprises a transmembrane domain. Any suitable transmembrane domain can be used in a CAR of the invention. The transmembrane domain can be derived from a natural, synthetic, semi-synthetic, or recombinant source. According to some embodiments, the transmembrane domain is a transmembrane domain from a peptide selected from the group consisting of a CD8 α peptide, a CD28 peptide, a CD4 peptide, a CD3 ζ peptide, a CD2 peptide, a 4-1BB peptide, an OX40 peptide, an ICOS peptide, a CTLA-4 peptide, a PD-1 peptide, a LAG-3 peptide, a 2B4 peptide, a BTLA peptide, a GMCSFR peptide, and the like. In particular embodiments, the transmembrane domain is a CD8 α transmembrane domain. The CD8 α transmembrane domain can comprise an amino acid sequence at least 90% identical to SEQ ID NO:342, preferably the amino acid sequence of SEQ ID NO:342.

[00137] A CAR of the invention comprises an intracellular signaling domain. Any suitable intracellular domain can be used in a CAR of the invention. In particular embodiments, the entire intracellular signaling domain is used. In other particular embodiments, a truncated portion of the signaling domain that transduces the effector or signal is used. According to embodiments of the invention, the intracellular signaling domain generates a signal that promotes an immune effector function of the CAR-containing cell, e.g., a CAR-T cell, including, but not limited to, proliferation, activation, and/or differentiation. In particular embodiments, the signal promotes, e.g., cytolytic activity, helper activity, and/or cytokine secretion of the CAR-T cell. According to some embodiments, the intracellular signaling domain of the CAR comprises a signaling domain of an Fc γ receptor (Fc γ R), an Fc ϵ receptor (Fc ϵ R), an Fc α receptor (Fc α R), neonatal Fc receptor (FcRn), CD3, CD3 ζ , CD3 γ , CD3 δ , CD3 ϵ , CD4, CD5, CD8, CD21, CD22, CD28, CD32, CD40L (CD154), CD45, CD66 δ , CD79 α , CD79 β , CD80, CD86, CD278 (also known as ICOS), CD247 ζ , CD247 η , DAP10, DAP12, FYN, LAT, Lck, MAPK, MHC complex, NFAT, NF- κ B, PLC- γ , iC3b,

C3dg, C3d, and Zap70. According to some embodiments, the intracellular signaling domain is selected from the group consisting of a signaling domain of CD3 ζ , FcR γ , FcR β , CD3 γ , CD3 δ , CD3 ϵ , CD5, CD22, CD79 α , CD79 β , and CD66 δ .

- [00138]** According to particular embodiments, the intracellular signaling domain further comprises one or more co-stimulatory signaling domains. The co-stimulatory domain can, for example, comprise a signaling domain of a peptide selected from: 2B4/CD244/SLAMF4, 4-1BB/TNFSF9/CD137, B7-1/CD80, B7-2/CD86, B7-H1/PD-L1, B7-H2, B7-H3, B7-H4, B7-H6, B7-H7, BAFF-R/TNFSF13C, BAFF/BLyS/TNFSF13B, BLAME/SLAMF8, BTLA/CD272, CD100 (SEMA4D), CD103, CD11a, CD11b, CD11c, CD11d, CD150, CD160 (BY55), CD18, CD19, CD2, CD200, CD229/SLAMF3, CD27 Ligand/TNFSF7, CD27/TNFSF7, CD28, CD29, CD2F-10/SLAMF9, CD30 Ligand/TNFSF8, CD30/TNFSF8, CD300a/LMIR1, CD4, CD40 Ligand/TNFSF5, CD40/TNFSF5, CD48/SLAMF2, CD49a, CD49D, CD49f, CD53, CD58/LFA-3, CD69, CD7, CD8 α , CD8 β , CD82/Kai-1, CD84/SLAMF5, CD90/Thy1, CD96, CDS, CEACAM1, CRACC/SLAMF7, CRTAM, CTLA-4, DAP12, Dectin-1/CLEC7A, DNAM1 (CD226), DPPIV/CD26, DR3/TNFSF25, EphB6, GADS, Gi24/VISTA/B7-H5, GITR Ligand/TNFSF18, GITR/TNFSF18, HLA Class I, HLA-DR, HVEM/TNFSF14, IA4, ICAM-1, ICOS/CD278, Ikaros, IL2R β , IL2R γ , IL7R α , Integrin α 4/CD49d, Integrin α 4 β 1, Integrin α 4 β 7/LPAM-1, IPO-3, ITGA4, ITGA6, ITGAD, ITGAE, ITGAL, ITGAM, ITGAX, ITGB1, ITGB2, ITGB7, KIRDS2, LAG-3, LAT, LIGHT/TNFSF14, LTBR, Ly108, Ly9 (CD229), lymphocyte function associated antigen-1 (LFA-1), Lymphotoxin- α /TNF- β , NKG2C, NKG2D, NKp30, NKp44, NKp46, NKp80 (KLRP1), NTB-A/SLAMF6, OX40 Ligand/TNFSF4, OX40/TNFSF4, PAG/Cbp, PD-1, PDCD6, PD-L2/B7-DC, PSGL1, RELT/TNFSF19L, SELPLG (CD162), SLAM (SLAMF1), SLAM/CD150, SLAMF4 (CD244), SLAMF6 (NTB-A), SLAMF7, SLP-76, TACI/TNFSF13B, TCL1A, TCL1B, TIM-1/KIM-1/HAVCR, TIM-4, TL1A/TNFSF15, TNF RII/TNFSF1B, TNF- α , TRANCE/RANKL, TSLP, TSLP R, VLA1, and VLA-6. In certain embodiments, the costimulatory domain is selected from the group consisting of a costimulatory domain of one or more of CD28, 4-1BB (CD137), CD27, OX40, CD27, CD40, PD-1, ICOS, lymphocyte function-associated antigen-1 (LFA-1), CD2, CD7, LIGHT, NKG2C, B7-H3, TNFSF9, TNFSF4, TNFSF8, CD40LG, ITGB2, KLRC2, TNFSF18, TNFSF14, HAVCR1, LGALS9, CD83, and a ligand that specifically binds with CD83.

[00139] In certain embodiments, the CAR is a tandem CAR that binds specifically to FSHR and mesothelin. Preferably, the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:370-379 and SEQ ID NOs: 448-450.

[00140] In certain embodiments, the CAR binds specifically to mesothelin. Preferably, the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:358-367 and SEQ ID NOs:445-447.

5 [00141] In certain embodiments, an isolated polynucleotide comprising a nucleotide sequence encoding a protein that is subsequently cleaved to produce a dual CAR containing a first CAR that binds specifically to FSHR and a second CAR that binds specifically to mesothelin. Preferably, the protein comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:380-389 and SEQ ID NOs:451-453.

10 [00142] According to particular aspects, the isolated polynucleotide comprising the nucleotide sequence encoding a CAR further comprises a third nucleotide sequence. The third nucleotide sequence can, for example, encode a dominant negative form of an inhibitor of the cell-mediated immune response of the immune cell. The inhibitor of a cell-mediated immune response of the immune cell can, for example, be a transforming growth factor β (TGF- β) receptor (e.g., TGF β RII). In certain embodiments, the dominant negative form of the inhibitor comprises the amino acid sequence of SEQ ID NO:347.

15 [00143] The nucleotide sequence encoding the CAR can, for example, be connected to the third nucleotide sequence encoding the dominant negative form of the inhibitor of the cell-mediated immune response via a 2A peptide coding sequence.

20 [00144] In certain embodiments, an isolated polynucleotide comprising a nucleotide sequence encoding a protein that is subsequently cleaved to produce a protein that is subsequently cleaved to product one or more CARs and a dominant negative form of an inhibitor of the cell-mediated immune response of the immune cell. Preferably, the protein comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:390-419 and SEQ ID NOs:460-468.

[00145] **Immune Cells**

25 [00146] According to particular aspects, the invention provides cells that are immune cells that comprise the isolated polynucleotides or vectors comprising the isolated polynucleotides comprising the nucleotide sequence encoding the CAR are provided herein. The immune cells comprising the isolated polynucleotides and/or vectors of the invention can be referred to as “engineered immune cells.” Preferably, the engineered immune cells are derived from a human (are of human origin prior to being made recombinant).

30 [00147] The engineered immune cells can, for example, be cells of the lymphoid lineage. Non-limiting examples of cells of the lymphoid lineage can include T cells and Natural Killer (NK) cells. T cells express the T cell receptor (TCR), with most cells expressing α and β chains and a smaller population expressing γ and δ chains. T cells useful as engineered immune cells of the

invention can be CD4⁺ or CD8⁺ and can include, but are not limited to, T helper cells (CD4⁺), cytotoxic T cells (also referred to as cytotoxic T lymphocytes, CTL; CD8⁺ cells), and memory T cells, including central memory T cells, stem-like memory T cells, and effector memory T cells, natural killer T cells, mucosal associated invariant T cells, and $\gamma\delta$ T cells. Other exemplary

5 immune cells include, but are not limited to, macrophages, antigen presenting cells (APCs), or any immune cell that expresses an inhibitor of a cell-mediated immune response, for example, an immune checkpoint inhibitor pathway receptor (e.g., PD-1). Precursor cells of immune cells that can be used according to the invention, include, hematopoietic stem and/or progenitor cells. Hematopoietic stem and/or progenitor cells can be derived from bone marrow, umbilical cord

10 blood, adult peripheral blood after cytokine mobilization, and the like, by methods known in the art. The immune cells are engineered to recombinantly express the CARs of the invention.

[00148] Immune cells and precursor cells thereof can be isolated by methods known in the art, including commercially available methods (see, e.g., Rowland Jones et al., *Lymphocytes: A Practical Approach*, Oxford University Press, NY (1999)). Sources for immune cells or

15 precursors thereof include, but are not limited to, peripheral blood, umbilical cord blood, bone marrow, or other sources of hematopoietic cells. Various techniques can be employed to separate the cells to isolated or enrich desired immune cells. For instance, negative selection methods can be used to remove cells that are not the desired immune cells. Additionally, positive selection methods can be used to isolated or enrich for the desired immune cells or precursors thereof, or a combination of positive and negative selection methods can be employed. If a particular type of

20 cell is to be isolated, e.g., a particular T cell, various cell surface markers or combinations of markers (e.g., CD3, CD4, CD8, CD34) can be used to separate the cells.

[00149] The immune cells or precursor cells thereof can be autologous or non-autologous to the subject to which they are administered in the methods of treatment of the invention. Autologous

25 cells are isolated from the subject to which the engineered immune cells recombinantly expressing the CAR are to be administered. Optionally, the cells can be obtained by leukapheresis, where leukocytes are selectively removed from withdrawn blood, made recombinant, and then retransfused into the donor. Alternatively, allogeneic cells from a non-autologous donor that is not the subject can be used. In the case of a non-autologous donor, the

30 cells are typed and matched for human leukocyte antigen (HLA) to determine the appropriate level of compatibility. For both autologous and non-autologous cells, the cells can optionally be cryopreserved until ready for use.

[00150] Various methods for isolating immune cells that can be used for recombinant expression of the CARs of the invention have been described previously, and can be used,

including, but not limited to, using peripheral donor lymphocytes (Sadelain et al., Nat. Rev. Cancer 3:35-45 (2003); Morgan et al., Science 314:126-9 (2006)), using lymphocyte cultures derived from tumor infiltrating lymphocytes (TILs) in tumor biopsies (Panelli et al., J. Immunol. 164:495-504 (2000); Panelli et al., J. Immunol. 164:4382-92 (2000)), and using selectively *in vitro* expanded antigen-specific peripheral blood leukocytes employing artificial antigen-presenting cells (AAPCs) or dendritic cells (Dupont et al., Cancer Res. 65:5417-427 (2005); Papanicolaou et al., Blood 102:2498-505 (2003)). In the case of using stem cells, the cells can be isolated by methods well known in the art (see, e.g., Klug et al., Hematopoietic Stem Cell Protocols, Humana Press, NJ (2002); Freshney et al., Culture of Human Stem Cells, John Wiley & Sons (2007)).

[00151] According to particular embodiments, the method of making the engineered immune cells comprises transfecting or transducing immune effector cells isolated from an individual such that the immune effector cells express one or more CAR(s) according to embodiments of the invention. Methods of preparing immune cells for immunotherapy are described, e.g., in WO2014/130635, WO2013/176916 and WO2013/176915, which are incorporated herein by reference. Individual steps that can be used for preparing engineered immune cells are disclosed, e.g., in WO2014/039523, WO2014/184741, WO2014/191128, WO2014/184744 and WO2014/184143, which are incorporated herein by reference.

[00152] In a particular embodiment, the immune effector cells, such as T cells, are genetically modified with CARs of the invention (e.g., transduced with a viral vector comprising a nucleic acid encoding a CAR) and then are activated and expanded *in vitro*. In various embodiments, T cells can be activated and expanded before or after genetic modification to express a CAR, using methods as described, for example, in US6352694, US6534055, US6905680, US6692964, US5858358, US6887466, US6905681, US7144575, US7067318, US7172869, US7232566, US7175843, US5883223, US6905874, US6797514, US6867041, US2006/121005, which are incorporated herein by reference. T cells can be expanded *in vitro* or *in vivo*. Generally, the T cells of the invention can be expanded by contact with a surface having attached thereto an agent that stimulates a CD3/TCR complex-associated signal and a ligand that stimulates a co-stimulatory molecule on the surface of the T cells. As non-limiting examples, T cell populations can be stimulated as described herein, such as by contact with an anti-CD3 antibody, or antigen-binding fragment thereof, or an anti-CD2 antibody immobilized on a surface, or by contact with a protein kinase C activator (e.g., bryostatin) in conjunction with a calcium ionophore, or by activation of the CAR itself. For co-stimulation of an accessory molecule on the surface of the T cells, a ligand that binds the accessory molecule is used. For example, a population of T cells can

be contacted with an anti-CD3 antibody and an anti-CD28 antibody, under conditions appropriate for stimulating proliferation of the T cells. Conditions appropriate for T cell culture include, e.g., an appropriate media (e.g., Minimal Essential Media or RPMI Media 1640 or, X-vivo 5 (Lonza)) that can contain factors necessary for proliferation and viability, including serum (e.g., fetal bovine or human serum), cytokines, such as IL-2, IL-7, IL-15, and/or IL-21, insulin, IFN-g, GM-CSF, TGF β and/or any other additives for the growth of cells known to the skilled artisan. In other embodiments, the T cells can be activated and stimulated to proliferate with feeder cells and appropriate antibodies and cytokines using methods such as those described in US6040177, US5827642, and WO2012129514, which are incorporated herein by reference.

10 **[00153] Antigen-binding fragments**

[00154] Antibodies

[00155] The invention generally relates to CAR constructs comprising an antigen binding fragment. The antigen binding fragment can, for example, be an antibody or antigen binding fragment thereof that specifically binds a tumor antigen. In certain aspects, the invention relates to an isolated antibody or antigen binding fragment that specifically binds a tumor antigen. The invention also generally relates to isolated anti-mesothelin antibodies, nucleic acids and expression vectors encoding the antibodies, recombinant cells containing the vectors, compositions comprising the antibodies, methods of making the antibodies, and methods of using the antibodies to treat diseases including cancer. The antibodies of the invention possess one or more desirable functional properties, including but not limited to high-affinity binding to a tumor antigen (e.g., mesothelin), high specificity to a tumor antigen (e.g., mesothelin), the ability to stimulate complement-dependent cytotoxicity (CDC), antibody-dependent phagocytosis (ADPC), and/or antibody-dependent cellular-mediated cytotoxicity (ADCC) against cells expressing a tumor antigen (e.g., mesothelin), and the ability to inhibit tumor growth in subjects in need thereof and in animal models when administered alone or in combination with other anti-cancer therapies.

[00156] The antigen binding fragment can, for example, be an antibody or antigen binding fragment thereof that specifically binds a tumor antigen. Any suitable tumor antigen for binding by an antibody or antigen binding fragment can be chosen based on the type of tumor and/or cancer exhibited by the subject to be treated. Suitable antigens include, but are not limited to, mesothelin (MSLN), prostate specific membrane antigen (PSMA), prostate stem cell antigen (PSCA), carbonic anhydrase IX (CAIX), carcinoembryonic antigen (CEA), CD5, CD7, CD10, CD19, CD20, CD22, CD30, CD33, CD34, CD38, CD41, CD44, CD49f, CD56, CD74, CD123, CD133, CD138, epithelial glycoprotein-2 (EGP 2), epithelial glycoprotein-40 (EGP-40),

- epithelial adhesion molecule (EpCAM), folate-binding protein (FBP), fetal acetylcholine receptor (AChR), folate receptor α and β (FR α and β), ganglioside G2 (GD2), ganglioside G3 (GD3), human epidermal growth factor receptor 2 (HER-2/ERB2), epidermal growth factor receptor (EGFR), epidermal growth factor receptor vIII (EGFRvIII), ERB3, ERB4, human telomerase
- 5 reverse transcriptase (hTERT), interleukin-13 receptor subunit alpha-2 (IL-13R α 2), k-light chain, kinase insert domain receptor (KDR), Lewis A (CA19.9), Lewis Y (LeY), L1 cell adhesion molecule (LICAM), melanoma-associated antigen 1 (melanoma antigen family A1, MAGE-A1), Mucin-16 (Muc-16), Mucin 1 (Muc-1), NKG2D ligands, cancer-testis antigen NY-ESO-1, oncofetal antigen (h5T4), tumor-associated glycoprotein 72 (TAG-72), vascular endothelial
- 10 growth factor receptor (VEGFR), vascular endothelial growth factor R2 (VEGF-R2), Wilms tumor protein (WT-1), type 1 tyrosine-protein kinase transmembrane receptor (ROR1), B7-H3 (CD276), B7-H6 (Nkp30), chondroitin sulfate proteoglycan-4 (CSPG4), DNAX accessory molecule (DNAM-1), ephrin type A receptor 2 (EpHA2), fibroblast associated protein (FAP), Gp100/HLA-A2, glypican 3 (GPC3), HA-1H, HERK-V, IL-11R α , latent membrane protein
- 15 (LMP1), neural cell-adhesion molecule (N-CAM/CD56), and trail receptor (TRAIL R). Suitable antigens are preferably selected from the group consisting of mesothelin, folate receptor α , mucin 16, prostate-specific membrane antigen (PSMA), human epidermal growth factor receptor 2 (HER2), epidermal growth factor receptor (EGFR), and vascular endothelial growth factor receptor (VEGFR).
- 20 **[00157]** In a general aspect, the invention relates to CAR constructs comprising antibodies or antigen binding fragments thereof that bind mesothelin and/or antibodies or antigen binding fragments thereof that bind mesothelin.
- [00158]** As used herein, the term “antibody” is used in a broad sense and includes immunoglobulin or antibody molecules including human, humanized, composite and chimeric
- 25 antibodies and antibody fragments that are monoclonal or polyclonal. In general, antibodies are proteins or peptide chains that exhibit binding specificity to a specific antigen. Antibody structures are well known. Immunoglobulins can be assigned to five major classes (i.e., IgA, IgD, IgE, IgG and IgM), depending on the heavy chain constant domain amino acid sequence. IgA and IgG are further sub-classified as the isotypes IgA1, IgA2, IgG1, IgG2, IgG3 and IgG4.
- 30 Accordingly, the antibodies of the invention can be of any of the five major classes or corresponding sub-classes. Preferably, the antibodies of the invention are IgG1, IgG2, IgG3 or IgG4. Antibody light chains of vertebrate species can be assigned to one of two clearly distinct types, namely kappa and lambda, based on the amino acid sequences of their constant domains. Accordingly, the antibodies of the invention can contain a kappa or lambda light chain constant

domain. According to particular embodiments, the antibodies of the invention include heavy and/or light chain constant regions from rat or human antibodies. In addition to the heavy and light constant domains, antibodies contain an antigen-binding region that is made up of a light chain variable region and a heavy chain variable region, each of which contains three domains (i.e., complementarity determining regions 1-3; CDR1, CDR2, and CDR3). The light chain variable region domains are alternatively referred to as LCDR1, LCDR2, and LCDR3, and the heavy chain variable region domains are alternatively referred to as HCDR1, HCDR2, and HCDR3.

[00159] As used herein, the term an “isolated antibody” refers to an antibody which is substantially free of other antibodies having different antigenic specificities (e.g., an isolated antibody that specifically binds to mesothelin is substantially free of antibodies that do not bind to mesothelin). In addition, an isolated antibody is substantially free of other cellular material and/or chemicals.

[00160] As used herein, the term “monoclonal antibody” refers to an antibody obtained from a population of substantially homogeneous antibodies, i.e., the individual antibodies comprising the population are identical except for possible naturally occurring mutations that can be present in minor amounts. The monoclonal antibodies of the invention can be made by the hybridoma method, phage display technology, single lymphocyte gene cloning technology, or by recombinant DNA methods. For example, the monoclonal antibodies can be produced by a hybridoma which includes a B cell obtained from a transgenic nonhuman animal, such as a transgenic mouse or rat, having a genome comprising a human heavy chain transgene and a light chain transgene.

[00161] As used herein, the term “antigen-binding fragment” refers to an antibody fragment such as, for example, a diabody, a Fab, a Fab', a F(ab')₂, an Fv fragment, a disulfide stabilized Fv fragment (dsFv), a (dsFv)₂, a bispecific dsFv (dsFv-dsFv'), a disulfide stabilized diabody (ds diabody), a single-chain antibody molecule (scFv), a single domain antibody (sdAb), a scFv dimer (bivalent diabody), a multispecific antibody formed from a portion of an antibody comprising one or more CDRs, a camelized single domain antibody, a minibody, a nanobody, a domain antibody, a bivalent domain antibody, a light chain variable domain (VL), a variable domain (V_HH) of a camelid antibody, or any other antibody fragment that binds to an antigen but does not comprise a complete antibody structure. An antigen-binding fragment is capable of binding to the same antigen to which the parent antibody or a parent antibody fragment binds.

[00162] As used herein, the term “single-chain antibody” refers to a conventional single-chain antibody in the field, which comprises a heavy chain variable region and a light chain variable region connected by a short peptide of about 15 to about 20 amino acids (e.g., a linker peptide).

[00163] As used herein, the term “single domain antibody” refers to a conventional single domain antibody in the field, which comprises a heavy chain variable region and a heavy chain constant region or which comprises only a heavy chain variable region.

[00164] As used herein, the term “human antibody” refers to an antibody produced by a human or an antibody having an amino acid sequence corresponding to an antibody produced by a human made using any technique known in the art. This definition of a human antibody includes intact or full-length antibodies, fragments thereof, and/or antibodies comprising at least one human heavy and/or light chain polypeptide.

[00165] As used herein, the term “humanized antibody” refers to a non-human antibody that is modified to increase the sequence homology to that of a human antibody, such that the antigen-binding properties of the antibody are retained, but its antigenicity in the human body is reduced.

[00166] As used herein, the term “chimeric antibody” refers to an antibody wherein the amino acid sequence of the immunoglobulin molecule is derived from two or more species. The variable region of both the light and heavy chains often corresponds to the variable region of an antibody derived from one species of mammal (e.g., mouse, rat, rabbit, etc.) having the desired specificity, affinity, and capability, while the constant regions correspond to the sequences of an antibody derived from another species of mammal (e.g., human) to avoid eliciting an immune response in that species.

[00167] As used herein, the term “multispecific antibody” refers to an antibody that comprises a plurality of immunoglobulin variable domain sequences, wherein a first immunoglobulin variable domain sequence of the plurality has binding specificity for a first epitope and a second immunoglobulin variable domain sequence of the plurality has binding specificity for a second epitope. In an embodiment, the first and second epitopes are on the same antigen, e.g., the same protein (or subunit of a multimeric protein). In an embodiment, the first and second epitopes overlap or substantially overlap. In an embodiment, the first and second epitopes do not overlap or do not substantially overlap. In an embodiment, the first and second epitopes are on different antigens, e.g., the different proteins (or different subunits of a multimeric protein). In an embodiment, a multispecific antibody comprises a third, fourth, or fifth immunoglobulin variable domain. In an embodiment, a multispecific antibody is a bispecific antibody molecule, a trispecific antibody molecule, or a tetraspecific antibody molecule.

- [00168] As used herein, the term “bispecific antibody” refers to a multispecific antibody that binds no more than two epitopes or two antigens. A bispecific antibody is characterized by a first immunoglobulin variable domain sequence which has binding specificity for a first epitope and a second immunoglobulin variable domain sequence that has binding specificity for a second epitope. In an embodiment, the first and second epitopes are on the same antigen, *e.g.*, the same protein (or subunit of a multimeric protein). In an embodiment, the first and second epitopes overlap or substantially overlap. In an embodiment, the first and second epitopes are on different antigens, *e.g.*, the different proteins (or different subunits of a multimeric protein). In an embodiment, a bispecific antibody comprises a heavy chain variable domain sequence and a light chain variable domain sequence which have binding specificity for a first epitope and a heavy chain variable domain sequence and a light chain variable domain sequence which have binding specificity for a second epitope. In an embodiment, a bispecific antibody comprises a half antibody, or fragment thereof, having binding specificity for a first epitope and a half antibody, or fragment thereof, having binding specificity for a second epitope. In an embodiment, a bispecific antibody comprises a scFv, or fragment thereof, having binding specificity for a first epitope, and a scFv, or fragment thereof, having binding specificity for a second epitope. In an embodiment, the first epitope is located on mesothelin and the second epitope is located on PD-1, PD-L1, CTLA-4, EGFR, HER-2, CD19, CD20, CD33, CD3, and/or other tumor associated immune suppressors or surface antigens.
- [00169] As used herein, the term “mesothelin” refers to a 71-kD precursor protein, which is the cleaved by the endoprotease furin to release the secreted N-terminal region, called megakaryocyte potentiating factor (MPF). The 41-kD mature mesothelin (*i.e.*, MPF) remains attached to the membrane (Yamaguchi N, et al., *Biol Chem.* 1994; 269: 805-808). The remaining GPI-linked mature mesothelin can also be shed from the cell through the action of the tumor necrosis factor α -converting enzyme protease (Zhang Y, et al., *Cancer Res.* 2011; 71: 5915-5922). The correlation of serum level of shed mesothelin with disease suggested a potential role for the mesothelin protein in cancer progression. While the biological function of mesothelin is not well understood. Mesothelin is known to bind to the ovarian cancer antigen MUC16 (cancer antigen 125) that has been shown to induce cell-to-cell adhesion and possibly contribute to peritoneal seeding and metastatic spread (Gubbels JA, et al., *Mol Cancer.* 2006; 5: 50). Furthermore, mesothelin knockout mice grow and reproduce normally and have no detectable phenotype. Bera TK, et al., *Mol Cell Biol.* 2000; 20: 2902-2906. The full length sequence of human mesothelin is provided by SEQ ID NO:315, and the sequence of the human 41-kD mature mesothelin is provided by SEQ ID NO:318.

[00170] As used herein, an antibody that “specifically binds to mesothelin” refers to an antibody that binds to a mesothelin, preferably a human mesothelin, with a K_D of 1×10^{-7} M or less, preferably 1×10^{-8} M or less, more preferably 5×10^{-9} M or less, 1×10^{-9} M or less, 5×10^{-10} M or less, or 1×10^{-10} M or less. The term “ K_D ” refers to the dissociation constant, which is obtained from the ratio of K_d to K_a (i.e., K_d/K_a) and is expressed as a molar concentration (M). K_D values for antibodies can be determined using methods in the art in view of the present disclosure. For example, the K_D of an antibody can be determined by using surface plasmon resonance, such as by using a biosensor system, e.g., a Biacore® system, or by using bio-layer interferometry technology, such as an Octet RED96 system.

[00171] The smaller the value of the K_D of an antibody, the higher affinity that the antibody binds to a target antigen.

[00172] According to particular aspects, the invention relates to a CAR construct comprising an antigen binding fragment, wherein the antigen binding fragment is an antibody or antigen binding fragment that specifically binds a tumor antigen and/or an isolated antibody or antigen binding fragment that specifically binds a tumor antigen. The antibody or antigen binding fragment can, for example, be a Fab, a Fab', a $F(ab')_2$, an Fv, a single-chain variable fragment (scFv), a minibody, a diabody, a single-domain antibody (sdAb), a light chain variable domain (VL), or a variable domain (V_{HH}) of a camelid antibody.

[00173] In certain embodiments, the antibody or antigen binding fragment is a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2, and CDR3 having the polypeptide sequences of:

- a. SEQ ID NOs:34, 102, and 170, respectively;
- b. SEQ ID NOs:54, 122, and 190, respectively;
- c. SEQ ID NOs:55, 123, and 191, respectively;
- d. SEQ ID NOs:61, 129, and 197, respectively;
- e. SEQ ID NOs:31, 99, and 167, respectively;
- f. SEQ ID NOs:32, 100, and 168, respectively;
- g. SEQ ID NOs:33, 101, and 169, respectively;
- h. SEQ ID NOs:35, 103, and 171, respectively;
- i. SEQ ID NOs:36, 104, and 172, respectively;
- j. SEQ ID NOs:37, 105, and 173, respectively;
- k. SEQ ID NOs:38, 106, and 174, respectively;
- l. SEQ ID NOs:39, 107, and 175, respectively;
- m. SEQ ID NOs:40, 108, and 176, respectively;

- n. SEQ ID NOs:41, 109, and 177, respectively;
 o. SEQ ID NOs:42, 110, and 178, respectively;
 p. SEQ ID NOs:43, 111, and 179, respectively;
 q. SEQ ID NOs:44, 112, and 180, respectively;
 5 r. SEQ ID NOs:45, 113, and 181, respectively;
 s. SEQ ID NOs:46, 114, and 182, respectively;
 t. SEQ ID NOs:47, 115, and 183, respectively;
 u. SEQ ID NOs:48, 116, and 184, respectively;
 v. SEQ ID NOs:49, 117, and 185, respectively;
 10 w. SEQ ID NOs:50, 118, and 186, respectively;
 x. SEQ ID NOs:51, 119, and 187, respectively;
 y. SEQ ID NOs:52, 120, and 188, respectively;
 z. SEQ ID NOs:53, 121, and 189, respectively;
 aa. SEQ ID NOs:56, 124, and 192, respectively;
 15 bb. SEQ ID NOs:57, 125, and 193, respectively;
 cc. SEQ ID NOs:58, 126, and 194, respectively;
 dd. SEQ ID NOs:59, 127, and 195, respectively;
 ee. SEQ ID NOs:60, 128, and 196, respectively;
 ff. SEQ ID NOs:62, 130, and 198, respectively;
 20 gg. SEQ ID NOs:63, 131, and 199, respectively;
 hh. SEQ ID NOs:64, 132, and 200, respectively;
 ii. SEQ ID NOs:65, 133, and 201, respectively;
 jj. SEQ ID NOs:66, 134, and 202, respectively;
 kk. SEQ ID NOs:67, 135, and 203, respectively;
 25 ll. SEQ ID NOs:68, 136, and 204, respectively; or
 a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid
 substitutions in the CDR regions;
 wherein the single domain antibody binds specifically to mesothelin, preferably human
 mesothelin. In certain embodiments the single domain antibody comprises an amino acid
 30 sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%,
 98%, or 99% identical to an amino acid sequence selected from the group consisting of SEQ ID
 NOs:221-258 and SEQ ID NOs: 420-428. In certain embodiments, the single domain antibody
 comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258

and SEQ ID NOs: 420-428, or a variant thereof. Preferably, the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.

[00174] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:31, 99, and 167, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:221. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:221.

[00175] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:32, 100, and 168, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:222. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:222.

[00176] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:33, 101, and 169, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:223. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:223.

[00177] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:34, 102, and 170, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:224, 420, 421 or 422. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:224, 420, 421 or 422.

[00178] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:35, 103, and 171, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:225. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:225.

[00179] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:36, 104, and 172, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:226. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:226.

[00180] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:37, 105, and 173, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:227. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:227.

[00181] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:38, 106, and 174, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:228. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:228.

[00182] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3,

having the polypeptide sequences of SEQ ID NOs:39, 107, and 175, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:229. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:229.

[00183] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:40, 108, and 176, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:230. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:230.

[00184] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:41, 109, and 177, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:231. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:231.

[00185] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:42, 110, and 178, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:232. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:232.

[00186] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:43, 111, and 179, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated

sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:233. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:233.

- 5 [00187] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:44, 112, and 180, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or
10 more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:234. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:234.

- [00188] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3,
15 having the polypeptide sequences of SEQ ID NOs:45, 113, and 181, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:235. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ
20 ID NO:235.

- [00189] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:46, 114, and 182, respectively. In another
25 embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:236. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:236.

- [00190] In one embodiment, the invention relates to a CAR construct comprising a single
30 domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:47, 115, and 183, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:237. Preferably, the CAR

construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:237.

[00191] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:48, 116, and 184, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:238. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:238.

[00192] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:49, 117, and 185, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:239. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:239.

[00193] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:50, 118, and 186, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:240. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:240.

[00194] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:51, 119, and 187, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:241. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:241.

[00195] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:52, 120, and 188, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:242. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:242.

[00196] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:53, 121, and 189, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:243. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:243.

[00197] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:54, 122, and 190, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:244. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:244.

[00198] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:55, 123, and 191, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:245. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:245.

[00199] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3,

having the polypeptide sequences of SEQ ID NOs:56, 124, and 192, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:246. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:246.

[00200] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:57, 125, and 193, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:247. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:247.

[00201] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:58, 126, and 194, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:248. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:248.

[00202] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:59, 127, and 195, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:249. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:249.

[00203] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:60, 128, and 196, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated

sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:250. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:250.

- 5 [00204] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:61, 129, and 197, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or
10 more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:251. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:251.

- [00205] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3,
15 having the polypeptide sequences of SEQ ID NOs:62, 130, and 198, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:252. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ
20 ID NO:252.

- [00206] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:63, 131, and 199, respectively. In another
25 embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:253. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:253.

- [00207] In one embodiment, the invention relates to a CAR construct comprising a single
30 domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:64, 132, and 200, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:254. Preferably, the CAR

construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:254.

[00208] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:65, 133, and 201, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:255. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:255.

[00209] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:66, 134, and 202, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:256, 426, 427 or 428. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:256, 426, 427 or 428.

[00210] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:67, 135, and 203, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:257, 423, 424 or 425. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:257, 423, 424 or 425.

[00211] In one embodiment, the invention relates to a CAR construct comprising a single domain antibody or an isolated single domain antibody comprising a CDR1, CDR2, and CDR3, having the polypeptide sequences of SEQ ID NOs:68, 136, and 204, respectively. In another embodiment, the CAR construct comprising the single domain antibody (sdAb) or the isolated sdAb comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:258. Preferably, the CAR construct comprising the sdAb or the isolated sdAb comprises the polypeptide sequence of SEQ ID NO:258.

[00212] In certain embodiments, the antibody or antigen binding fragment thereof is a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:

- 5 a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
- b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
- c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
- d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
- e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
- 10 f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
- g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
- h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
- i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
- j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
- 15 k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
- l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
- m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
- n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively;
- o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively; or
- 20 a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid substitutions in the CDR regions;

wherein the scFv binds specifically to mesothelin, preferably human mesothelin. In certain embodiments, the scFv comprises an amino acid sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220.

[00213] In certain embodiments, the antibody or antigen binding fragment thereof is a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:

- 30 a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
- b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
- c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
- d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
- e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;

- f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
 5 j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
 10 o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively, or
 a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid
 substitutions in the CDR regions,
 wherein the scFv binds specifically to mesothelin, preferably human mesothelin. In certain
 embodiments, the scFv comprises an amino acid sequence at least 85%, preferably 90%, more
 15 preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to an amino acid
 sequence selected from the group consisting of SEQ ID NOs:205-220. In certain embodiments,
 the single domain antibody comprises an amino acid sequence selected from the group consisting
 of SEQ ID NOs: 205-220, or a variant thereof. Preferably, the variant comprises one, two, three
 or more amino acid substitutions, deletions and/or insertions.
- 20 **[00214]** In one embodiment, the invention relates to a CAR construct comprising a single chain
 variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1,
 LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:1, 69, 137, 2, 70, and
 138, respectively. In another embodiment, the CAR construct comprising the scFv and/or the
 isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably
 25 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:205 or 206.
 Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a
 polypeptide sequence of SEQ ID NO:205 or 206.
- 30 **[00215]** In one embodiment, the invention relates to a CAR construct comprising a single chain
 variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1,
 LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:3, 71, 139, 4, 72, and
 140, respectively. In another embodiment, the CAR construct comprising the scFv and/or the
 isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably
 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:207. Preferably,

the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:207.

[00216] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:208. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:208.

[00217] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:209. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:209.

[00218] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:210. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:210.

[00219] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:211. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:211.

[00220] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:212. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:212.

[00221] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:213. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:213.

[00222] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:214. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:214.

[00223] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:215. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:215.

[00224] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1,

LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:216. Preferably,
5 the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:216.

[00225] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:23, 91, 159, 24, 92, and
10 160, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:217. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:217.

[00226] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably
20 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:218. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:218.

[00227] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively. In another embodiment, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably
25 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:219. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:219.

[00228] In one embodiment, the invention relates to a CAR construct comprising a single chain variable fragment (scFv) or an isolated scFv, comprising HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3, having the polypeptide sequences of SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively. In another embodiment, the CAR construct comprising the scFv and/or the

isolated scFv comprises a polypeptide sequence at least 85%, preferably 90%, more preferably 95% or more, such as 95%, 96%, 97%, 98%, or 99% identical to SEQ ID NO:220. Preferably, the CAR construct comprising the scFv and/or the isolated scFv comprises a polypeptide sequence of SEQ ID NO:220.

- 5 **[00229]** In another general aspect, the invention relates to a method of producing a modified TCR complex, a CAR construct or an antibody or antigen-binding fragment thereof of the invention, comprising culturing a cell comprising a nucleic acid encoding a protein of the modified TCR complex, the CAR construct or the antibody or antigen-binding fragment thereof under conditions to produce the modified TCR complex, the CAR construct or the antibody or antigen-binding fragment thereof of the invention. Optionally, the method further comprises recovering modified TCR complex, the CAR construct or the antibody or antigen-binding fragment thereof from the cell or cell culture (e.g., from the supernatant). Expressed antibodies or antigen-binding fragments thereof can be harvested from the cells and purified according to conventional techniques known in the art and as described herein.
- 10 **[00230] Follicle stimulating hormone receptor (FSHR) binding peptides**
[00231] As used herein, the term “FSHR binding domain” or “FSHR binding peptide” refers to a peptide domain or polypeptide that specifically binds to a follicle stimulating hormone receptor (FSHR). In certain embodiments, the FSHR binding domain can comprise a follicle-stimulating hormone (FSH) or fragment thereof, a FSHR antagonist or fragment thereof, an antigen binding fragment that binds specifically to FSHR, and/or an anti-FSHR agonist or fragment thereof.
- 15 **[00232]** As used herein, the term “FSHR antagonist” refers to a molecule or fragment thereof that has affinity for a FSHR. The FSHR antagonist has affinity to the active site of FSHR, a similar or the same binding site as FSH. FSHR antagonist binding affinity to the FSHR can be reversible or irreversible.
- 20 **[00233]** In certain aspects, provided herein are CARs, wherein the CAR comprises an extracellular domain comprising a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR). The first polypeptide can, for example, be a FSHR binding peptide. The FSHR binding peptide can, for example, be a FSH or fragment thereof, a FSHR antagonist or fragment thereof, an anti-FSHR antibody or fragment thereof, or an anti-FSHR agonist or fragment thereof.
- 25 **[00234]** In certain embodiments, the FSHR binding peptide can comprise an amino acid sequence derived from a FSH molecule. The FSHR binding peptide includes fragments, peptides, or polypeptide sequences derived from a FSH molecule. In one embodiment, the FSHR binding peptide comprises a FSH β 33-53 peptide. In another embodiment, the FSHR binding peptide
- 30

comprises a FSH β 51-65 peptide. In another embodiment, the FSHR binding peptide comprises a FSH β 81-95 peptide.

[00235] The FSHR binding peptide can include any fragment or a FSH molecule. In certain embodiments, the FSHR binding peptide comprises at least 10 amino acids of the FSH molecule.

5 The FSHR binding peptide can, include, at least about 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, or more amino acids of a FSH molecule. In certain embodiments, the FSHR binding peptide can be about 6 to about 50 amino acids, about 10 to about 45 amino acids, about 15 to about 40 amino acids, about 20 to about 35 amino acids, or about 25 to about 30
10 amino acids of the FSH molecule. The FSHR binding peptide retains the capacity to bind to FSHR.

[00236] In certain embodiments, the FSHR binding peptide comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331. In certain embodiments, the FSHR binding peptide has 80%, 81%, 82%, 83%, 84%, 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%,
15 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331. In certain embodiments, the FSHR binding peptide has an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331, or a variant thereof comprising up to about 5 (such as about any of 1, 2, 3, 4 or 5) amino acid substitutions.

20 **[00237] Dominant negative forms of an inhibitor of a cell-mediated immune response**

[00238] An inhibitor of a cell-mediated immune response of the immune cell or precursor cell thereof refers to a molecule that acts to inhibit or suppress the immune response effected by the immune cell or precursor cell thereof. In certain embodiments, the inhibitor of a cell-mediated immune response can, for example, be an immune checkpoint inhibitor.

25 **[00239]** In certain aspects, provided herein are engineered immune cells that express a CAR comprising a dominant-negative form of an inhibitor of a cell-mediated immune response of the immune cell. By way of a non-limiting example, the dominant negative form of an inhibitor can be a receptor that functions in an immune checkpoint inhibitor pathway. Immune checkpoint pathways can suppress the immune response of an immune cell. The pathways can deliver
30 negative signals to the immune cells and attenuate TCR-mediated signals, which can lead to decreased cell proliferation, cytokine production and cell cycle progression (Pardoll, Nat. Rev. 12:252-64 (2012); Wu et al., Int. J. Biol. Sci. 8:1420-30 (2012)). Examples of immune checkpoint inhibitor pathway receptors can include, but are not limited to, PD-1, CTLA-4, BTLA, TIM-3, LAG-3, CD160, TIGIT, LAIR1, 2B4, and the like (Chen et al., Nat. Rev. Immunol.

13(4):227-42 (2013)). The corresponding ligands for these receptors include, for example, PD-L1 (for PD-1); PD-L2 (for PD-1); CD80, CD86 (for CTLA-4); HVEM (for BTLA); Galectin-9, HMGB1 (for TIM-3); MHCII (for LAG-3); HVEM (for CD160); CD155, CD112, CD113 (for TIGIT); C1q, collagen (for LAIR1); CD48 (for 2B4), and the like (Chen et al., Nat. Rev.

- 5 Immunol. 13(4):227-42 (2013)). Expression of a dominant negative form in the immune cell provides for inhibition of a checkpoint inhibitor pathway that is intrinsic to the cell.

[00240] In certain embodiments, the dominant negative form of an inhibitor of a cell-mediated immune response of the immune cell is a dominant negative transforming growth factor- β receptor type II (dnTGF β RII). A TGF- β receptor type II can have an amino acid sequence
10 corresponding to GenBank No. NP_001020018.1 or fragments thereof. The domains of the TGF β RII include a signal peptide (amino acids 1-22), an extracellular domain (amino acids 23-191), a transmembrane domain (amino acids 192-212), and an intracellular domain (amino acids 213-592) (see, e.g., GenBank No. NP_001020018.1).

[00241] In certain embodiments, the CAR comprises a dominant negative form of TGF β RII
15 (dnTGF β RII). In one embodiment, the dnTGF β RII comprises an extracellular ligand binding domain of TGF β RII. In one embodiment, the dnTGF β RII comprises the extracellular ligand binding domain and a transmembrane domain. In another embodiment, the dnTGF β RII comprises the extracellular ligand binding domain of TGF β RII, a transmembrane domain and a signal peptide.

20 [00242] dnTGF β RII forms have been described previously (see, e.g., Bottinger et al., EMBO J 16:2621-33 (1997); Foster et al., J. Immunother. 31:500-5 (2008); Bollard et al., Blood 99:3179-87 (2002); Wieser et al., Mol. Cell. Biol. 13:7239-47 (1993)). In certain embodiments, the dnTGF β RII comprises the amino acid sequence of SEQ ID NO:347.

[00243] The isolated polynucleotide comprising the first nucleotide sequence encoding a CAR
25 and the third nucleotide sequence encoding a dnTGF β RII, can, for example have the first nucleotide sequence connected to the third nucleotide sequence via a third nucleotide sequence encoding a 2A peptide. The 2A peptide is typically 16-20 amino acids in sequence, for example, P2A. When the 2A peptide is encoded between two open reading frames in a multicistronic mRNA, it causes the ribosome to halt at the carboxy-terminus of the 2A peptide in the translating
30 polypeptide, thus resulting in the separation of the polypeptides derived from each open reading frame. The separation point is at the carboxy-terminus of the 2A peptide, with the first amino acid of the downstream open reading frame being a proline. 2A peptides are described, for example, in International Patent Publication No. WO2017/040815.

[00244] Polynucleotides, vectors, and host cells

[00245] In another general aspect, the invention relates to an isolated nucleic acid encoding a chimeric antigen receptor (CAR) and/or an antibody or antigen-binding fragment thereof of the invention. It will be appreciated by those skilled in the art that the coding sequence of a protein
5 can be changed (e.g., replaced, deleted, inserted, etc.) without changing the amino acid sequence of the protein. Accordingly, it will be understood by those skilled in the art that nucleic acid sequences encoding CARS and/or antibodies or antigen-binding fragments thereof of the invention can be altered without changing the amino acid sequences of the proteins.

[00246] In another general aspect, the invention relates to a vector comprising a CAR and/or an
10 isolated nucleic acid encoding the antibody or antigen-binding fragment thereof of the invention. Any vector known to those skilled in the art in view of the present disclosure can be used, such as a plasmid, a cosmid, a phage vector or a viral vector. In some embodiments, the vector is a recombinant expression vector such as a plasmid. The vector can include any element to establish a conventional function of an expression vector, for example, a promoter, ribosome binding
15 element, terminator, enhancer, selection marker, and origin of replication. The promoter can be a constitutive, inducible, or repressible promoter. A number of expression vectors capable of delivering nucleic acids to a cell are known in the art and can be used herein for production of a CAR and/or an antibody or antigen-binding fragment thereof in the cell. Conventional cloning techniques or artificial gene synthesis can be used to generate a recombinant expression vector
20 according to embodiments of the invention.

[00247] In another general aspect, the invention relates to a host cell comprising a vector of the invention and/or an isolated nucleic acid encoding a CAR and/or an antibody or antigen-binding fragment thereof of the invention. Any host cell known to those skilled in the art in view of the present disclosure can be used for recombinant expression of CARs and/or antibodies or antigen-
25 binding fragments thereof of the invention. Suitable host cells include prokaryotes, yeast, mammalian cells, or bacterial cells. In some embodiments, the host cells are *E. coli* TG1 or BL21 cells (for expression of, e.g., a CAR, a scFv, or sdAb), CHO-DG44 or CHO-K1 cells or HEK293 cells (for expression of, e.g., a full-length IgG antibody). According to particular embodiments, the recombinant expression vector is transformed into host cells by conventional methods such as
30 chemical transfection, heat shock, or electroporation, where it is stably integrated into the host cell genome such that the recombinant nucleic acid is effectively expressed.

[00248] Pharmaceutical Compositions

[00249] In another general aspect, the invention relates to a pharmaceutical composition comprising an isolated polynucleotide of the invention, an isolated polypeptide of the invention, a

host cell of the invention, an engineered immune cell of the invention, and/or an antibody or antigen binding fragment thereof of the invention and a pharmaceutically acceptable carrier. The term “pharmaceutical composition” as used herein means a product comprising an isolated polynucleotide of the invention, an isolated polypeptide of the invention, a host cell of the invention, and/or an engineered immune cell of the invention together with a pharmaceutically acceptable carrier. Polynucleotides, polypeptides, host cells, engineered immune cells, and/or antibodies or antigen binding fragments of the invention and compositions comprising them are also useful in the manufacture of a medicament for therapeutic applications mentioned herein.

[00250] As used herein, the term “carrier” refers to any excipient, diluent, filler, salt, buffer, stabilizer, solubilizer, oil, lipid, lipid containing vesicle, microsphere, liposomal encapsulation, or other material well known in the art for use in pharmaceutical formulations. It will be understood that the characteristics of the carrier, excipient or diluent will depend on the route of administration for a particular application. As used herein, the term “pharmaceutically acceptable carrier” refers to a non-toxic material that does not interfere with the effectiveness of a composition according to the invention or the biological activity of a composition according to the invention. According to particular embodiments, in view of the present disclosure, any pharmaceutically acceptable carrier suitable for use in a polynucleotide, polypeptide, host cell, engineered immune cell, and/or antibody pharmaceutical composition can be used in the invention.

[00251] The formulation of pharmaceutically active ingredients with pharmaceutically acceptable carriers is known in the art, e.g., Remington: The Science and Practice of Pharmacy (e.g. 21st edition (2005), and any later editions). Non-limiting examples of additional ingredients include: buffers, diluents, solvents, tonicity regulating agents, preservatives, stabilizers, and chelating agents. One or more pharmaceutically acceptable carrier may be used in formulating the pharmaceutical compositions of the invention.

[00252] Methods of use

[00253] In another general aspect, the invention relates to a method of treating a cancer in a subject in need thereof. The methods comprise administering to the subject in need thereof a therapeutically effective amount of an isolated polynucleotide, an isolated polypeptide, a host cell, an engineered immune cell, an antibody or antigen binding fragment thereof, and/or a pharmaceutical composition of the invention. The cancer, can, for example, be selected from an ovarian cancer, a primary peritoneal carcinoma, a pancreatic ductal adenocarcinoma (PDA), a malignant pleural mesothelioma (MPM), a lung adenocarcinoma, a triple negative breast cancer, an endometrial cancer, a biliary cancer, a gastric cancer, or a pediatric acute myeloid leukemia.

[00254] According to embodiments of the invention, the pharmaceutical composition comprises a therapeutically effective amount of an isolated polynucleotide, an isolated polypeptide, a host cell, an engineered immune cell, and/or an antibody or antigen binding fragment. As used herein, the term “therapeutically effective amount” refers to an amount of an active ingredient or
5 component that elicits the desired biological or medicinal response in a subject. A therapeutically effective amount can be determined empirically and in a routine manner, in relation to the stated purpose.

[00255] As used herein with reference to an isolated polynucleotide, an isolated polypeptide, a host cell, an engineered immune cell, an antibody or antigen binding fragment, and/or a
10 pharmaceutical composition of the invention a therapeutically effective amount means an amount of the isolated polynucleotide, the isolated polypeptide, the host cell, the engineered immune cell, the antibody or antigen binding fragment, and/or the pharmaceutical composition that modulates an immune response in a subject in need thereof.

[00256] According to particular embodiments, a therapeutically effective amount refers to the
15 amount of therapy which is sufficient to achieve one, two, three, four, or more of the following effects: (i) reduce or ameliorate the severity of the disease, disorder or condition to be treated or a symptom associated therewith; (ii) reduce the duration of the disease, disorder or condition to be treated, or a symptom associated therewith; (iii) prevent the progression of the disease, disorder or condition to be treated, or a symptom associated therewith; (iv) cause regression of the disease,
20 disorder or condition to be treated, or a symptom associated therewith; (v) prevent the development or onset of the disease, disorder or condition to be treated, or a symptom associated therewith; (vi) prevent the recurrence of the disease, disorder or condition to be treated, or a symptom associated therewith; (vii) reduce hospitalization of a subject having the disease, disorder or condition to be treated, or a symptom associated therewith; (viii) reduce
25 hospitalization length of a subject having the disease, disorder or condition to be treated, or a symptom associated therewith; (ix) increase the survival of a subject with the disease, disorder or condition to be treated, or a symptom associated therewith; (xi) inhibit or reduce the disease, disorder or condition to be treated, or a symptom associated therewith in a subject; and/or (xii) enhance or improve the prophylactic or therapeutic effect(s) of another therapy.

[00257] The therapeutically effective amount or dosage can vary according to various factors,
30 such as the disease, disorder or condition to be treated, the means of administration, the target site, the physiological state of the subject (including, e.g., age, body weight, health), whether the subject is a human or an animal, other medications administered, and whether the treatment is

prophylactic or therapeutic. Treatment dosages are optimally titrated to optimize safety and efficacy.

[00258] According to particular embodiments, the compositions described herein are formulated to be suitable for the intended route of administration to a subject. For example, the compositions described herein can be formulated to be suitable for intravenous, subcutaneous, or intramuscular administration.

[00259] The cells of the invention can be administered in any convenient manner known to those skilled in the art. For example, the cells of the invention can be administered to the subject by aerosol inhalation, injection, ingestion, transfusion, implantation, and/or transplantation. The compositions comprising the cells of the invention can be administered transarterially, subcutaneously, intradermally, intratumorally, intranodally, intramedullary, intramuscularly, intrapleurally, by intravenous (i.v.) injection, or intraperitoneally. In certain embodiments, the cells of the invention can be administered with or without lymphodepletion of the subject.

[00260] The pharmaceutical compositions comprising cells of the invention expressing CARs of the invention can be provided in sterile liquid preparations, typically isotonic aqueous solutions with cell suspensions, or optionally as emulsions, dispersions, or the like, which are typically buffered to a selected pH. The compositions can comprise carriers, for example, water, saline, phosphate buffered saline, and the like, suitable for the integrity and viability of the cells, and for administration of a cell composition.

[00261] Sterile injectable solutions can be prepared by incorporating cells of the invention in a suitable amount of the appropriate solvent with various other ingredients, as desired. Such compositions can include a pharmaceutically acceptable carrier, diluent, or excipient such as sterile water, physiological saline, glucose, dextrose, or the like, that are suitable for use with a cell composition and for administration to a subject, such as a human. Suitable buffers for providing a cell composition are well known in the art. Any vehicle, diluent, or additive used is compatible with preserving the integrity and viability of the cells of the invention.

[00262] The cells of the invention can be administered in any physiologically acceptable vehicle. A cell population comprising cells of the invention can comprise a purified population of cells. Those skilled in the art can readily determine the cells in a cell population using various well known methods. The ranges in purity in cell populations comprising genetically modified cells of the invention can be from about 50% to about 55%, from about 55% to about 60%, from about 60% to about 65%, from about 65% to about 70%, from about 70% to about 75%, from about 75% to about 80%, from about 80% to about 85%, from about 85% to about 90%, from

about 90% to about 95%, or from about 95% to about 100%. Dosages can be readily adjusted by those skilled in the art, for example, a decrease in purity could require an increase in dosage.

[00263] The cells of the invention are generally administered as a dose based on cells per kilogram (cells/kg) of body weight of the subject to which the cells are administered. Generally, the cell doses are in the range of about 10^4 to about 10^{10} cells/kg of body weight, for example, about 10^5 to about 10^9 , about 10^5 to about 10^8 , about 10^5 to about 10^7 , or about 10^5 to about 10^6 , depending on the mode and location of administration. In general, in the case of systemic administration, a higher dose is used than in regional administration, where the immune cells of the invention are administered in the region of a tumor and/or cancer. Additionally, the dose can be adjusted to account for whether a single dose is being administered or whether multiple doses are being administered. The precise determination of what would be considered an effective dose can be based on factors individual to each subject.

[00264] As used herein, the terms "treat," "treating," and "treatment" are all intended to refer to an amelioration or reversal of at least one measurable physical parameter related to a cancer, which is not necessarily discernible in the subject, but can be discernible in the subject. The terms "treat," "treating," and "treatment," can also refer to causing regression, preventing the progression, or at least slowing down the progression of the disease, disorder, or condition. In a particular embodiment, "treat," "treating," and "treatment" refer to an alleviation, prevention of the development or onset, or reduction in the duration of one or more symptoms associated with the disease, disorder, or condition, such as a tumor or more preferably a cancer. In a particular embodiment, "treat," "treating," and "treatment" refer to prevention of the recurrence of the disease, disorder, or condition. In a particular embodiment, "treat," "treating," and "treatment" refer to an increase in the survival of a subject having the disease, disorder, or condition. In a particular embodiment, "treat," "treating," and "treatment" refer to elimination of the disease, disorder, or condition in the subject.

EMBODIMENTS

[00265] This invention provides the following non-limiting embodiments.

[00266] Embodiment 1 an isolated polynucleotide comprising a nucleotide sequence encoding a chimeric antigen receptor (CAR), wherein the CAR comprises:

(a) an extracellular domain comprising a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR), and an antigen binding fragment that binds specifically to a tumor antigen;

(b) a transmembrane domain; and

(c) an intracellular signaling domain,

wherein the CAR optionally further comprises a signal peptide at its amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain.

5 [00267] Embodiment 1a is the isolated polynucleotide of embodiment 1, wherein the first polypeptide is an antigen binding fragment that binds specifically to the FSHR, preferably a human FSHR.

[00268] Embodiment 1b is the isolated polynucleotide of embodiment 1a, wherein the first polypeptide that binds specifically to the FSHR comprises a Fab, a Fab', a F(ab')₂, an Fv, a single-chain variable fragment (scFv), a minibody, a diabody, a single-domain antibody (sdAb), a light chain variable domain (VL), a heavy chain only antibody, or a variable domain (V_{HH}) of a camelid antibody.

[00269] Embodiment 2 is the isolated polynucleotide of embodiment 1, wherein the first polypeptide comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331.

15 [00270] Embodiment 3 is the isolated polynucleotide of any one of embodiments 1 to 2, wherein the first polypeptide is connected to the amino terminus of the antigen binding fragment via a linker.

[00271] Embodiment 3a is the isolated polynucleotide of embodiment 1 or 2, wherein the first polypeptide is connected to the carboxy terminus of the antigen binding fragment via a linker.

20 [00272] Embodiment 4 is the isolated polynucleotide of any one of embodiments 1 to 3a, wherein the tumor antigen is selected from the group consisting of mesothelin, folate receptor α , mucin 16 (MUC16), prostate-specific membrane antigen (PSMA), human epidermal growth factor receptor 2 (HER2), epidermal growth factor receptor (EGFR), and vascular endothelial growth factor receptor (VEGFR).

25 [00273] Embodiment 5 is the isolated polynucleotide of embodiment 4, wherein the tumor antigen is mesothelin, preferably human mesothelin.

[00274] Embodiment 5a is the isolated polynucleotide of embodiment 4, wherein the tumor antigen is MUC16, preferably human MUC16.

30 [00275] Embodiment 5b is the isolated polynucleotide of embodiment 4, wherein the tumor antigen is PSMA, preferably human PSMA.

[00276] Embodiment 5c is the isolated polynucleotide of embodiment 4, wherein the tumor antigen is HER2, preferably human HER2.

[00277] Embodiment 5d is the isolated polynucleotide of embodiment 4, wherein the tumor antigen is EGFR, preferably human EGFR.

[00278] Embodiment 5e is the isolated polynucleotide of embodiment 4, wherein the tumor antigen is VEGFR, preferably human VEGFR.

[00279] Embodiment 6 is the isolated polynucleotide of any one of embodiments 5 to 5e, wherein the antigen binding fragment is a Fab, a Fab', a F(ab')₂, an Fv, a single-chain variable fragment (scFv), a minibody, a diabody, a single-domain antibody (sdAb), a light chain variable domain (VL), a heavy chain only antibody, or a variable domain (V_HH) of a camelid antibody.

[00280] Embodiment 6a is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a Fab.

[00281] Embodiment 6b is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a Fab'.

[00282] Embodiment 6c is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a F(ab')₂.

[00283] Embodiment 6d is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a Fv.

[00284] Embodiment 6e is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a scFv.

[00285] Embodiment 6f is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a minibody.

[00286] Embodiment 6g is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a diabody.

[00287] Embodiment 6h is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a sdAb.

[00288] Embodiment 6i is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a VL.

[00289] Embodiment 6j is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a heavy chain only antibody.

[00290] Embodiment 6k is the isolated polynucleotide of embodiment 6, wherein the antigen binding fragment is a V_HH of a camelid antibody.

[00291] Embodiment 7 is the isolated polynucleotide of any one of embodiments 6 to 6k, wherein the antigen binding fragment comprises:

- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;

- c. SEQ ID NOs:55, 123, and 191, respectively;
- d. SEQ ID NOs:61, 129, and 197, respectively;
- e. SEQ ID NOs:31, 99, and 167, respectively;
- f. SEQ ID NOs:32, 100, and 168, respectively;
- 5 g. SEQ ID NOs:33, 101, and 169, respectively;
- h. SEQ ID NOs:35, 103, and 171, respectively;
- i. SEQ ID NOs:36, 104, and 172, respectively;
- j. SEQ ID NOs:37, 105, and 173, respectively;
- k. SEQ ID NOs:38, 106, and 174, respectively;
- 10 l. SEQ ID NOs:39, 107, and 175, respectively;
- m. SEQ ID NOs:40, 108, and 176, respectively;
- n. SEQ ID NOs:41, 109, and 177, respectively;
- o. SEQ ID NOs:42, 110, and 178, respectively;
- p. SEQ ID NOs:43, 111, and 179, respectively;
- 15 q. SEQ ID NOs:44, 112, and 180, respectively;
- r. SEQ ID NOs:45, 113, and 181, respectively;
- s. SEQ ID NOs:46, 114, and 182, respectively;
- t. SEQ ID NOs:47, 115, and 183, respectively;
- u. SEQ ID NOs:48, 116, and 184, respectively;
- 20 v. SEQ ID NOs:49, 117, and 185, respectively;
- w. SEQ ID NOs:50, 118, and 186, respectively;
- x. SEQ ID NOs:51, 119, and 187, respectively;
- y. SEQ ID NOs:52, 120, and 188, respectively;
- z. SEQ ID NOs:53, 121, and 189, respectively;
- 25 aa. SEQ ID NOs:56, 124, and 192, respectively;
- bb. SEQ ID NOs:57, 125, and 193, respectively;
- cc. SEQ ID NOs:58, 126, and 194, respectively;
- dd. SEQ ID NOs:59, 127, and 195, respectively;
- ee. SEQ ID NOs:60, 128, and 196, respectively;
- 30 ff. SEQ ID NOs:62, 130, and 198, respectively;
- gg. SEQ ID NOs:63, 131, and 199, respectively;
- hh. SEQ ID NOs:64, 132, and 200, respectively;
- ii. SEQ ID NOs:65, 133, and 201, respectively;
- jj. SEQ ID NOs:66, 134, and 202, respectively;

- kk. SEQ ID NOs:67, 135, and 203, respectively; or
 - ll. SEQ ID NOs:68, 136, and 204, respectively; or
 - ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:
 - a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 - b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 - c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 - d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
 - e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
 - f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 - g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 - h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 - i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
 - j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 - k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 - l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 - m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 - n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively;
 - o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively, or a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid substitutions in the CDR regions.
- [00292]** Embodiment 7a is the isolated polynucleotide of any one of embodiments 6 to 6k, wherein the antigen binding fragment comprises:
- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;
 - f. SEQ ID NOs:32, 100, and 168, respectively;
 - g. SEQ ID NOs:33, 101, and 169, respectively;

- h. SEQ ID NOs:35, 103, and 171, respectively;
i. SEQ ID NOs:36, 104, and 172, respectively;
j. SEQ ID NOs:37, 105, and 173, respectively;
k. SEQ ID NOs:38, 106, and 174, respectively;
5 l. SEQ ID NOs:39, 107, and 175, respectively;
m. SEQ ID NOs:40, 108, and 176, respectively;
n. SEQ ID NOs:41, 109, and 177, respectively;
o. SEQ ID NOs:42, 110, and 178, respectively;
p. SEQ ID NOs:43, 111, and 179, respectively;
10 q. SEQ ID NOs:44, 112, and 180, respectively;
r. SEQ ID NOs:45, 113, and 181, respectively;
s. SEQ ID NOs:46, 114, and 182, respectively;
t. SEQ ID NOs:47, 115, and 183, respectively;
u. SEQ ID NOs:48, 116, and 184, respectively;
15 v. SEQ ID NOs:49, 117, and 185, respectively;
w. SEQ ID NOs:50, 118, and 186, respectively;
x. SEQ ID NOs:51, 119, and 187, respectively;
y. SEQ ID NOs:52, 120, and 188, respectively;
z. SEQ ID NOs:53, 121, and 189, respectively;
20 aa. SEQ ID NOs:56, 124, and 192, respectively;
bb. SEQ ID NOs:57, 125, and 193, respectively;
cc. SEQ ID NOs:58, 126, and 194, respectively;
dd. SEQ ID NOs:59, 127, and 195, respectively;
ee. SEQ ID NOs:60, 128, and 196, respectively;
25 ff. SEQ ID NOs:62, 130, and 198, respectively;
gg. SEQ ID NOs:63, 131, and 199, respectively;
hh. SEQ ID NOs:64, 132, and 200, respectively;
ii. SEQ ID NOs:65, 133, and 201, respectively;
jj. SEQ ID NOs:66, 134, and 202, respectively;
30 kk. SEQ ID NOs:67, 135, and 203, respectively; or
ll. SEQ ID NOs:68, 136, and 204, respectively; or
ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:

- a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
- b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
- c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
- d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
- 5 e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
- f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
- g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
- h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
- i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
- 10 j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
- k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
- l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
- m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
- n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
- 15 o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively.

[00293] Embodiment 8 is the isolated polynucleotide of embodiment 7 or 7a, wherein the antigen binding fragment comprises:

- i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions; or
- 20 ii. the single chain variable fragment comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220, or a variant thereof, preferably the variant comprises one, two, three or
- 25 more amino acid substitutions, deletions and/or insertions.

[00294] Embodiment 8a is the isolated polynucleotide of embodiment 7 or 7a, wherein the antigen binding fragment comprises:

- i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof comprising one, two, three or more amino acid substitutions, deletions and/or
- 30 insertions; or
- ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220, or a variant thereof, preferably the

variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.

[00295] Embodiment 8b is the isolated polynucleotide of embodiment 7 or 7a, wherein the antigen binding fragment comprises:

- 5 i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428; or
- ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220.

[00296] Embodiment 9 is the isolated polynucleotide of any one of embodiments 1 to 8b, wherein the extracellular domain comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:348-357.

[00297] Embodiment 10 is an isolated polynucleotide comprising a nucleotide sequence encoding a chimeric antigen receptor (CAR), wherein the CAR comprises:

- 15 (a) an extracellular domain comprising an antigen binding fragment that binds specifically to mesothelin, preferably human mesothelin;
- (b) a transmembrane domain; and
- (c) an intracellular signaling domain,

wherein the CAR optionally further comprises a signal peptide at the amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain, and wherein the antigen binding fragment comprises:

- 20 i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - 25 a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;
 - f. SEQ ID NOs:32, 100, and 168, respectively;
 - g. SEQ ID NOs:33, 101, and 169, respectively;
 - 30 h. SEQ ID NOs:35, 103, and 171, respectively;
 - i. SEQ ID NOs:36, 104, and 172, respectively;
 - j. SEQ ID NOs:37, 105, and 173, respectively;
 - k. SEQ ID NOs:38, 106, and 174, respectively;
 - l. SEQ ID NOs:39, 107, and 175, respectively;

- m. SEQ ID NOs:40, 108, and 176, respectively;
- n. SEQ ID NOs:41, 109, and 177, respectively;
- o. SEQ ID NOs:42, 110, and 178, respectively;
- p. SEQ ID NOs:43, 111, and 179, respectively;
- 5 q. SEQ ID NOs:44, 112, and 180, respectively;
- r. SEQ ID NOs:45, 113, and 181, respectively;
- s. SEQ ID NOs:46, 114, and 182, respectively;
- t. SEQ ID NOs:47, 115, and 183, respectively;
- 10 u. SEQ ID NOs:48, 116, and 184, respectively;
- v. SEQ ID NOs:49, 117, and 185, respectively;
- w. SEQ ID NOs:50, 118, and 186, respectively;
- x. SEQ ID NOs:51, 119, and 187, respectively;
- y. SEQ ID NOs:52, 120, and 188, respectively;
- 15 z. SEQ ID NOs:53, 121, and 189, respectively;
- aa. SEQ ID NOs:56, 124, and 192, respectively;
- bb. SEQ ID NOs:57, 125, and 193, respectively;
- cc. SEQ ID NOs:58, 126, and 194, respectively;
- dd. SEQ ID NOs:59, 127, and 195, respectively;
- ee. SEQ ID NOs:60, 128, and 196, respectively;
- 20 ff. SEQ ID NOs:62, 130, and 198, respectively;
- gg. SEQ ID NOs:63, 131, and 199, respectively;
- hh. SEQ ID NOs:64, 132, and 200, respectively;
- ii. SEQ ID NOs:65, 133, and 201, respectively;
- jj. SEQ ID NOs:66, 134, and 202, respectively;
- 25 kk. SEQ ID NOs:67, 135, and 203, respectively; or
- ll. SEQ ID NOs:68, 136, and 204, respectively; or
- ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:
 - 30 a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 - b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 - c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 - d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;

- e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
- f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
- g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
- h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
- 5 i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
- j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
- k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
- l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
- m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
- 10 n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively;
- o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively, or
a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid
substitutions in the CDR regions.

[00298] Embodiment 10a is an isolated polynucleotide comprising a nucleotide sequence
15 encoding a chimeric antigen receptor (CAR), wherein the CAR comprises:

- (a) an extracellular domain comprising an antigen binding fragment that binds
specifically to mesothelin, preferably human mesothelin;
- (b) a transmembrane domain; and
- (c) an intracellular signaling domain,
- 20 wherein the CAR optionally further comprises a signal peptide at the amino terminus and a hinge
region connecting the extracellular domain and the transmembrane domain, and wherein the
antigen binding fragment comprises:
 - i. a single domain antibody (sdAb) comprising a complementarity determining region 1
(CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - 25 a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;
 - 30 f. SEQ ID NOs:32, 100, and 168, respectively;
 - g. SEQ ID NOs:33, 101, and 169, respectively;
 - h. SEQ ID NOs:35, 103, and 171, respectively;
 - i. SEQ ID NOs:36, 104, and 172, respectively;
 - j. SEQ ID NOs:37, 105, and 173, respectively;

- k. SEQ ID NOs:38, 106, and 174, respectively;
 l. SEQ ID NOs:39, 107, and 175, respectively;
 m. SEQ ID NOs:40, 108, and 176, respectively;
 n. SEQ ID NOs:41, 109, and 177, respectively;
 5 o. SEQ ID NOs:42, 110, and 178, respectively;
 p. SEQ ID NOs:43, 111, and 179, respectively;
 q. SEQ ID NOs:44, 112, and 180, respectively;
 r. SEQ ID NOs:45, 113, and 181, respectively;
 s. SEQ ID NOs:46, 114, and 182, respectively;
 10 t. SEQ ID NOs:47, 115, and 183, respectively;
 u. SEQ ID NOs:48, 116, and 184, respectively;
 v. SEQ ID NOs:49, 117, and 185, respectively;
 w. SEQ ID NOs:50, 118, and 186, respectively;
 x. SEQ ID NOs:51, 119, and 187, respectively;
 15 y. SEQ ID NOs:52, 120, and 188, respectively;
 z. SEQ ID NOs:53, 121, and 189, respectively;
 aa. SEQ ID NOs:56, 124, and 192, respectively;
 bb. SEQ ID NOs:57, 125, and 193, respectively;
 cc. SEQ ID NOs:58, 126, and 194, respectively;
 20 dd. SEQ ID NOs:59, 127, and 195, respectively;
 ee. SEQ ID NOs:60, 128, and 196, respectively;
 ff. SEQ ID NOs:62, 130, and 198, respectively;
 gg. SEQ ID NOs:63, 131, and 199, respectively;
 hh. SEQ ID NOs:64, 132, and 200, respectively;
 25 ii. SEQ ID NOs:65, 133, and 201, respectively;
 jj. SEQ ID NOs:66, 134, and 202, respectively;
 kk. SEQ ID NOs:67, 135, and 203, respectively; or
 ll. SEQ ID NOs:68, 136, and 204, respectively; or
 ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity
 30 determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity
 determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide
 sequences of:
 a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;

- c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
- d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
- e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
- f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
- 5 g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
- h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
- i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
- j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
- k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
- 10 l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
- m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
- n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
- o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively.

[00299] Embodiment 11 is the isolated polynucleotide of embodiment 10 or 10a, wherein the
15 antigen binding fragment is

- i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions, or
- 20 ii. the single chain variable fragment comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220 or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.

[00300] Embodiment 11a is the isolated polynucleotide of embodiment 10 or 10a, wherein the
25 antigen binding fragment comprises:

- i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof comprising one, two, three or more amino acid substitutions, deletions and/or insertions; or
- 30 ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.

[00301] Embodiment 11b is the isolated polynucleotide of embodiment 10 or 10a, wherein the antigen binding fragment comprises:

- i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428; or
- 5 ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220.

[00302] Embodiment 12 is the isolated polynucleotide of any one of embodiments 10 to 11b, wherein the polynucleotide further comprises a second nucleotide sequence encoding a second chimeric antigen receptor (CAR), wherein the second CAR comprises:

- 10 (a) an extracellular domain comprising a polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR);
- (b) a transmembrane domain; and
- (c) an intracellular signaling domain,

wherein the second CAR optionally further comprises a signal peptide at the amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain.

[00303] Embodiment 12a is the isolated polynucleotide of embodiment 12, wherein the nucleotide sequence encoding the CAR is connected to the second nucleotide sequence via a 2A peptide coding sequence.

[00304] Embodiment 12b is the isolated polynucleotide of embodiment 12 or 12a, wherein the 20 3'-end of the nucleotide sequence encoding the CAR is connected to the 5'-end of the second nucleotide sequence.

[00305] Embodiment 12c is the isolated polynucleotide of embodiment 12 or 12a, wherein the 3'-end of the second nucleotide sequence is connected to the 5'-end of the nucleotide sequence encoding the CAR.

25 [00306] Embodiment 12d is the isolated polynucleotide of any one of embodiment 12 to 12c, wherein the polypeptide that binds specifically to an FSHR is an antigen binding fragment that binds specifically to the FSHR, preferably a human FSHR.

[00307] Embodiment 12e is the isolated polynucleotide of embodiment 12d, wherein the antigen binding fragment that binds specifically to the FSHR is a Fab, a Fab', a F(ab')₂, an Fv, a 30 single-chain variable fragment (scFv), a minibody, a diabody, a single-domain antibody (sdAb), a light chain variable domain (VL), a heavy chain only antibody, or a variable domain (V_HH) of a camelid antibody.

[00308] Embodiment 13 is the isolated polynucleotide of any one of embodiments 12 to 12d, wherein the polypeptide that binds specifically to FSHR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331.

[00309] Embodiment 14 is the isolated polynucleotide of any one of embodiments 1-13,
5 wherein the CAR comprises a signal peptide having an amino acid sequence that is at least 90% identical to SEQ ID NO:340.

[00310] Embodiment 14a is the isolated polynucleotide of any one of embodiments 12-14, wherein the second CAR comprises a signal peptide having an amino acid sequence that is at least 90% identical to SEQ ID NO:340.

10 **[00311]** Embodiment 14b is the isolated polynucleotide of embodiment 14 or 14a, wherein the CAR and the second CAR comprise the same signal sequence.

[00312] Embodiment 14c is the isolated polynucleotide of embodiment 14 or 14a, wherein the CAR and the second CAR comprise different signal sequences.

[00313] Embodiment 15 is the isolated polynucleotide of any one of embodiments 1-14c,
15 wherein the CAR comprises a hinge region having an amino acid sequence that is at least 90% identical to SEQ ID NO:341.

[00314] Embodiment 15a is the isolated polynucleotide of any one of embodiments 12-15, wherein the second CAR comprises a hinge region having an amino acid sequence that is at least 90% identical to SEQ ID NO:341.

20 **[00315]** Embodiment 15b is the isolated polynucleotide of embodiment 15 or 15a, wherein the CAR and the second CAR comprise the same hinge region.

[00316] Embodiment 15c is the isolated polynucleotide of embodiment 15 or 15a, wherein the CAR and the second CAR comprise different hinge region.

[00317] Embodiment 16 is the isolated polynucleotide of any one of embodiments 1-15c,
25 wherein the CAR comprises a transmembrane domain selected from the group consisting of a CD8 α transmembrane domain, a CD28 transmembrane domain, a CD4 transmembrane domain, a CD3 ζ transmembrane domain, a CD2 transmembrane domain, a 4-1BB transmembrane domain, an OX40 transmembrane domain, an ICOS transmembrane domain, a CTLA-4 transmembrane domain, a PD-1 transmembrane domain, a LAG-3 transmembrane domain, a 2B4 transmembrane domain, a BTLA transmembrane domain, and a GMCSFR transmembrane domain.
30

[00318] Embodiment 16a is the isolated polynucleotide of any one of embodiments 12-16, wherein the second CAR comprises a transmembrane domain selected from the group consisting of a CD8 α transmembrane domain, a CD28 transmembrane domain, a CD4 transmembrane domain, a CD3 ζ transmembrane domain, a CD2 transmembrane domain, a 4-1BB transmembrane

domain, an OX40 transmembrane domain, an ICOS transmembrane domain, a CTLA-4 transmembrane domain, a PD-1 transmembrane domain, a LAG-3 transmembrane domain, a 2B4 transmembrane domain, a BTLA transmembrane domain, and a GMCSFR transmembrane domain.

- 5 [00319] Embodiment 16b is the isolated polynucleotide of embodiment 16 or 16a, wherein the CAR and the second CAR comprise the same transmembrane domain.
- [00320] Embodiment 16c is the isolated polynucleotide of embodiment 16 or 16a, wherein the CAR and the second CAR comprise different transmembrane domain.
- [00321] Embodiment 17 is the isolated polynucleotide of any one of embodiments 1-16c,
10 wherein the CAR comprises an intracellular signaling domain selected from the group consisting of a signaling domain of CD3 ζ , FcR γ , FcR β , CD3 γ , CD3 δ , CD3 ϵ , CD5, CD22, CD79 α , CD79 β , and CD66 δ .
- [00322] Embodiment 17a is the isolated polynucleotide of any one of embodiments 12-17, wherein the second CAR comprises an intracellular signaling domain selected from the group
15 consisting of a signaling domain of CD3 ζ , FcR γ , FcR β , CD3 γ , CD3 δ , CD3 ϵ , CD5, CD22, CD79 α , CD79 β , and CD66 δ .
- [00323] Embodiment 17b is the isolated polynucleotide of embodiment 17 or 17a, wherein the CAR and the second CAR comprise the same intracellular signaling domain.
- [00324] Embodiment 17c is the isolated polynucleotide of embodiment 17 or 17a, wherein the
20 CAR and the second CAR comprise different intracellular signaling domain.
- [00325] Embodiment 18 is the isolated polynucleotide of embodiment 17, wherein the CAR comprises a co-stimulatory domain selected from the group consisting of a co-stimulatory domain of one or more of CD28, 4-1BB (CD137), CD27, OX40, CD27, CD40, PD-1, ICOS, lymphocyte function-associated antigen-1 (LFA-1), CD2, CD7, LIGHT, NKG2C, B7-H3, TNFRSF9, TNFRSF4, TNFRSF8, CD40LG, ITGB2, KLRC2, TNFRSF18, TNFRSF14, HAVCR1, LGALS9, CD83, and a ligand that specifically binds with CD83.
25
- [00326] Embodiment 18a is the isolated polynucleotide of any one of embodiments 12-17, wherein the second CAR comprises a co-stimulatory domain selected from the group consisting of a co-stimulatory domain of one or more of CD28, 4-1BB (CD137), CD27, OX40, CD27, CD40, PD-1, ICOS, lymphocyte function-associated antigen-1 (LFA-1), CD2, CD7, LIGHT, NKG2C, B7-H3, TNFRSF9, TNFRSF4, TNFRSF8, CD40LG, ITGB2, KLRC2, TNFRSF18, TNFRSF14, HAVCR1, LGALS9, CD83, and a ligand that specifically binds with CD83.
30
- [00327] Embodiment 18b is the isolated polynucleotide of embodiment 18 or 18a, wherein the CAR and the second CAR comprise the same co-stimulatory domain.

[00328] Embodiment 18c is the isolated polynucleotide of embodiment 18 or 18a, wherein the CAR and the second CAR comprise different co-stimulatory domain.

[00329] Embodiment 19 is the isolated polynucleotide of embodiment 1, wherein the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:370-379 and SEQ ID NOs: 448-450.

[00330] Embodiment 20 is the isolated polynucleotide of embodiment 10, wherein the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:358-367 and SEQ ID NOs: 445-447.

[00331] Embodiment 20 is the isolated polynucleotide of embodiment 10, encoding a protein having an amino acid sequence selected from the group consisting of SEQ ID NOs: 380-389 and SEQ ID NOs:451-453.

[00332] Embodiment 21 is the isolated polynucleotide of any one of embodiments 1-20, further comprising a third nucleotide sequence encoding a dominant negative form of an inhibitor of a cell-mediated immune response of the immune cell.

[00333] Embodiment 22 is the isolated polynucleotide of embodiment 21, wherein the inhibitor of a cell-mediated immune response of the immune cell is a transforming growth factor β (TGF- β) receptor.

[00334] Embodiment 23 is the isolated polynucleotide of embodiment 22, wherein the dominant negative form of the inhibitor comprises the amino acid sequence of SEQ ID NO:347.

[00335] Embodiment 24 is the isolated polynucleotide of any one of embodiments 21-23, wherein the nucleotide sequence encoding the CAR is connected to the third nucleotide sequence via a 2A peptide coding sequence.

[00336] Embodiment 24a is the isolated polynucleotide of embodiment 24, wherein the 3'-end of the nucleotide sequence encoding the CAR is connected to the 5'-end of the third nucleotide sequence.

[00337] Embodiment 24b is the isolated polynucleotide of embodiment 24, wherein the 3'-end of the third nucleotide sequence is connected to the 5'-end of the nucleotide sequence encoding the CAR.

[00338] Embodiment 24c is the isolated polynucleotide of embodiment 24, wherein the 3'-end of the second nucleotide sequence is connected to the 5'-end of the third nucleotide sequence.

[00339] Embodiment 24d is the isolated polynucleotide of embodiment 24, wherein the 3'-end of the third nucleotide sequence is connected to the 5'-end of the second nucleotide sequence.

[00340] Embodiment 25 is the isolated polynucleotide of any one of embodiments 24 to 24d, wherein the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:390-419 and SEQ ID NOs: 460-468.

5 [00341] Embodiment 26 is a vector comprising the polynucleotide of any of embodiments 1-25 and 72-80.

[00342] Embodiment 27 is a host cell comprising the polynucleotide of any of claims 1-25 and 72-80 or the vector of embodiment 26.

10 [00343] Embodiment 28 is a method of treating a cancer in a subject in need thereof, comprising administering to the subject a therapeutically effective amount of the host cell of embodiment 27.

[00344] Embodiment 29 is an engineered immune cell expressing the CAR encoded by the polynucleotide of any of embodiments 1-25 or a modified TCR comprising the fusion protein encoded by the polypeptide of any of embodiments 72-80.

15 [00345] Embodiment 30 is the engineered immune cell of embodiment 29, wherein the engineered immune cell is selected from the group consisting of a cytotoxic T cell, a helper T cell, a natural killer cell, a $\gamma\delta$ T cell, and a NKT cell.

[00346] Embodiment 31 is a pharmaceutical composition, comprising the engineered immune cell of embodiment 29 or 30 and a pharmaceutically acceptable carrier.

20 [00347] Embodiment 32 is a method of treating a cancer in a subject in need thereof, comprising administering to the subject a therapeutically effective amount of the pharmaceutical composition of embodiment 31.

[00348] Embodiment 32a is the method of embodiment 32, wherein the engineered immune cell is autologous.

25 [00349] Embodiment 32b is the method of embodiment 32, wherein the engineered immune cell is allogeneic.

[00350] Embodiment 32c is the method of embodiment 32, wherein the engineered immune cell is syngeneic.

30 [00351] Embodiment 33 is the method of any one of embodiments 28, and 32-32c, wherein the cancer is selected from an ovarian cancer, a primary peritoneal carcinoma, a pancreatic ductal adenocarcinoma (PDA), a malignant pleural mesothelioma (MPM), a lung adenocarcinoma, a triple negative breast cancer, an endometrial cancer, a biliary cancer, a gastric cancer, or a pediatric acute myeloid leukemia, preferably an ovarian cancer.

[00352] Embodiment 34 is a method of engineering an immune cell, comprising introducing into the immune cell the polynucleotide of any of embodiments 1-25 and 72-80 operably linked to a promoter.

5 [00353] Embodiment 35 is a method of producing a pharmaceutical composition, comprising combining the engineered immune cell of embodiment 29 or 30 with a pharmaceutically acceptable carrier to obtain the pharmaceutical composition.

[00354] Embodiment 36 is a system for inducing the activity of an immune cell and/or a target cell, the system comprising an engineered cell comprising a chimeric antigen receptor (CAR), wherein the CAR comprises:

10 (a) an extracellular domain comprising a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR), and an antigen binding fragment that binds specifically to a tumor antigen;

(b) a transmembrane domain; and

(c) an intracellular signaling domain,

15 wherein the CAR optionally further comprises a signal peptide at its amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain.

[00355] Embodiment 37 is the system of embodiment 36, wherein the first polypeptide comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:319-331.

20 [00356] Embodiment 38 is the system of embodiment 36 or 37, wherein the first polypeptide is connected to the amino terminus or carboxy terminus of the antigen binding fragment via a linker.

[00357] Embodiment 39 is the system of any one of embodiments 36 to 38, wherein the tumor antigen is selected from the group consisting of mesothelin, folate receptor α , mucin 16 (MUC16), prostate-specific membrane antigen (PSMA), human epidermal growth factor receptor 2 (HER2), epidermal growth factor receptor (EGFR), and vascular endothelial growth factor receptor (VEGFR).

25

[00358] Embodiment 40 is the system of any one of embodiments 36 to 39, wherein the tumor antigen is mesothelin, preferably human mesothelin.

30 [00359] Embodiment 41 is the system of embodiment 40, wherein the antigen binding fragment is a Fab, a Fab', a F(ab')₂, an Fv, a single-chain variable fragment (scFv), a minibody, a diabody, a single-domain antibody (sdAb), a light chain variable domain (VL), or a variable domain (V_HH) of a camelid antibody.

[00360] Embodiment 42 is the system of embodiment 41, wherein the antigen binding fragment comprises:

- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
- a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - 5 c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;
 - f. SEQ ID NOs:32, 100, and 168, respectively;
 - g. SEQ ID NOs:33, 101, and 169, respectively;
 - 10 h. SEQ ID NOs:35, 103, and 171, respectively;
 - i. SEQ ID NOs:36, 104, and 172, respectively;
 - j. SEQ ID NOs:37, 105, and 173, respectively;
 - k. SEQ ID NOs:38, 106, and 174, respectively;
 - l. SEQ ID NOs:39, 107, and 175, respectively;
 - 15 m. SEQ ID NOs:40, 108, and 176, respectively;
 - n. SEQ ID NOs:41, 109, and 177, respectively;
 - o. SEQ ID NOs:42, 110, and 178, respectively;
 - p. SEQ ID NOs:43, 111, and 179, respectively;
 - q. SEQ ID NOs:44, 112, and 180, respectively;
 - 20 r. SEQ ID NOs:45, 113, and 181, respectively;
 - s. SEQ ID NOs:46, 114, and 182, respectively;
 - t. SEQ ID NOs:47, 115, and 183, respectively;
 - u. SEQ ID NOs:48, 116, and 184, respectively;
 - v. SEQ ID NOs:49, 117, and 185, respectively;
 - 25 w. SEQ ID NOs:50, 118, and 186, respectively;
 - x. SEQ ID NOs:51, 119, and 187, respectively;
 - y. SEQ ID NOs:52, 120, and 188, respectively;
 - z. SEQ ID NOs:53, 121, and 189, respectively;
 - aa. SEQ ID NOs:56, 124, and 192, respectively;
 - 30 bb. SEQ ID NOs:57, 125, and 193, respectively;
 - cc. SEQ ID NOs:58, 126, and 194, respectively;
 - dd. SEQ ID NOs:59, 127, and 195, respectively;
 - ee. SEQ ID NOs:60, 128, and 196, respectively;
 - ff. SEQ ID NOs:62, 130, and 198, respectively;

- gg. SEQ ID NOs:63, 131, and 199, respectively;
 - hh. SEQ ID NOs:64, 132, and 200, respectively;
 - ii. SEQ ID NOs:65, 133, and 201, respectively;
 - jj. SEQ ID NOs:66, 134, and 202, respectively;
 - 5 kk. SEQ ID NOs:67, 135, and 203, respectively; or
 - ll. SEQ ID NOs:68, 136, and 204, respectively; or
 - ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:
 - 10 a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 - b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 - c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 - d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
 - 15 e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
 - f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 - g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 - h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 - i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
 - 20 j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 - k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 - l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 - m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 - n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively;
 - 25 o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively; or
- a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid substitutions in the CDR regions.

[00361] Embodiment 42a is the system of embodiment 41, wherein the antigen binding fragment comprises:

- 30 i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;

- d. SEQ ID NOs:61, 129, and 197, respectively;
- e. SEQ ID NOs:31, 99, and 167, respectively;
- f. SEQ ID NOs:32, 100, and 168, respectively;
- g. SEQ ID NOs:33, 101, and 169, respectively;
- 5 h. SEQ ID NOs:35, 103, and 171, respectively;
- i. SEQ ID NOs:36, 104, and 172, respectively;
- j. SEQ ID NOs:37, 105, and 173, respectively;
- k. SEQ ID NOs:38, 106, and 174, respectively;
- l. SEQ ID NOs:39, 107, and 175, respectively;
- 10 m. SEQ ID NOs:40, 108, and 176, respectively;
- n. SEQ ID NOs:41, 109, and 177, respectively;
- o. SEQ ID NOs:42, 110, and 178, respectively;
- p. SEQ ID NOs:43, 111, and 179, respectively;
- q. SEQ ID NOs:44, 112, and 180, respectively;
- 15 r. SEQ ID NOs:45, 113, and 181, respectively;
- s. SEQ ID NOs:46, 114, and 182, respectively;
- t. SEQ ID NOs:47, 115, and 183, respectively;
- u. SEQ ID NOs:48, 116, and 184, respectively;
- v. SEQ ID NOs:49, 117, and 185, respectively;
- 20 w. SEQ ID NOs:50, 118, and 186, respectively;
- x. SEQ ID NOs:51, 119, and 187, respectively;
- y. SEQ ID NOs:52, 120, and 188, respectively;
- z. SEQ ID NOs:53, 121, and 189, respectively;
- aa. SEQ ID NOs:56, 124, and 192, respectively;
- 25 bb. SEQ ID NOs:57, 125, and 193, respectively;
- cc. SEQ ID NOs:58, 126, and 194, respectively;
- dd. SEQ ID NOs:59, 127, and 195, respectively;
- ee. SEQ ID NOs:60, 128, and 196, respectively;
- ff. SEQ ID NOs:62, 130, and 198, respectively;
- 30 gg. SEQ ID NOs:63, 131, and 199, respectively;
- hh. SEQ ID NOs:64, 132, and 200, respectively;
- ii. SEQ ID NOs:65, 133, and 201, respectively;
- jj. SEQ ID NOs:66, 134, and 202, respectively;
- kk. SEQ ID NOs:67, 135, and 203, respectively; or

- ii. SEQ ID NOs:68, 136, and 204, respectively; or
- ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:
- a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 - b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 - c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 - d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
 - e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
 - f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 - g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 - h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 - i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
 - j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 - k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 - l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 - m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 - n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
 - o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively.
- [00362]** Embodiment 43 is the system of embodiment 42 or 42a, wherein the antigen binding fragment comprises:
- i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions, or
 - ii. the single chain variable fragment comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220 or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.
- [00363]** Embodiment 43a is the isolated polynucleotide of embodiment 42 or 42a, wherein the antigen binding fragment comprises:
- i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant

thereof comprising one, two, three or more amino acid substitutions, deletions and/or insertions; or

- ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.

[00364] Embodiment 43b is the isolated polynucleotide of embodiment 42 or 42a, wherein the antigen binding fragment comprises:

- i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428; or
- ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220.

[00365] Embodiment 44 is the system of any one of embodiments 36 to 43b, wherein the extracellular domain comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:348-357.

[00366] Embodiment 45 is a system for inducing activity of an immune cell and/or a target cell, the system comprising an engineered cell comprising a chimeric antigen receptor (CAR), wherein the CAR comprises:

- (a) an extracellular domain comprising an antigen binding fragment that binds specifically to mesothelin, preferably human mesothelin;
- (b) a transmembrane domain; and
- (c) an intracellular signaling domain,

wherein the CAR optionally further comprises a signal peptide at the amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain, and

wherein the antigen binding fragment comprises:

- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;
 - f. SEQ ID NOs:32, 100, and 168, respectively;
 - g. SEQ ID NOs:33, 101, and 169, respectively;

- h. SEQ ID NOs:35, 103, and 171, respectively;
i. SEQ ID NOs:36, 104, and 172, respectively;
j. SEQ ID NOs:37, 105, and 173, respectively;
k. SEQ ID NOs:38, 106, and 174, respectively;
5 l. SEQ ID NOs:39, 107, and 175, respectively;
m. SEQ ID NOs:40, 108, and 176, respectively;
n. SEQ ID NOs:41, 109, and 177, respectively;
o. SEQ ID NOs:42, 110, and 178, respectively;
p. SEQ ID NOs:43, 111, and 179, respectively;
10 q. SEQ ID NOs:44, 112, and 180, respectively;
r. SEQ ID NOs:45, 113, and 181, respectively;
s. SEQ ID NOs:46, 114, and 182, respectively;
t. SEQ ID NOs:47, 115, and 183, respectively;
u. SEQ ID NOs:48, 116, and 184, respectively;
15 v. SEQ ID NOs:49, 117, and 185, respectively;
w. SEQ ID NOs:50, 118, and 186, respectively;
x. SEQ ID NOs:51, 119, and 187, respectively;
y. SEQ ID NOs:52, 120, and 188, respectively;
z. SEQ ID NOs:53, 121, and 189, respectively;
20 aa. SEQ ID NOs:56, 124, and 192, respectively;
bb. SEQ ID NOs:57, 125, and 193, respectively;
cc. SEQ ID NOs:58, 126, and 194, respectively;
dd. SEQ ID NOs:59, 127, and 195, respectively;
ee. SEQ ID NOs:60, 128, and 196, respectively;
25 ff. SEQ ID NOs:62, 130, and 198, respectively;
gg. SEQ ID NOs:63, 131, and 199, respectively;
hh. SEQ ID NOs:64, 132, and 200, respectively;
ii. SEQ ID NOs:65, 133, and 201, respectively;
jj. SEQ ID NOs:66, 134, and 202, respectively;
30 kk. SEQ ID NOs:67, 135, and 203, respectively; or
ll. SEQ ID NOs:68, 136, and 204, respectively; or
ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity
determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity

determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:

- a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
- b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
- 5 c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
- d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
- e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
- f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
- 10 g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
- h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
- i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
- j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
- k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
- 15 l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
- m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
- n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively;
- o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively; or

a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid substitutions in the CDR regions.

- 20 **[00367]** Embodiment 45a is a system for inducing activity of an immune cell and/or a target cell, the system comprising an engineered cell comprising a chimeric antigen receptor (CAR), wherein the CAR comprises:

(a) an extracellular domain comprising an antigen binding fragment that binds specifically to mesothelin, preferably human mesothelin;

- 25 (b) a transmembrane domain; and

(c) an intracellular signaling domain,

wherein the CAR optionally further comprises a signal peptide at the amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain, and

wherein the antigen binding fragment comprises:

- 30 i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
- a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;

- d. SEQ ID NOs:61, 129, and 197, respectively;
- e. SEQ ID NOs:31, 99, and 167, respectively;
- f. SEQ ID NOs:32, 100, and 168, respectively;
- g. SEQ ID NOs:33, 101, and 169, respectively;
- 5 h. SEQ ID NOs:35, 103, and 171, respectively;
- i. SEQ ID NOs:36, 104, and 172, respectively;
- j. SEQ ID NOs:37, 105, and 173, respectively;
- k. SEQ ID NOs:38, 106, and 174, respectively;
- l. SEQ ID NOs:39, 107, and 175, respectively;
- 10 m. SEQ ID NOs:40, 108, and 176, respectively;
- n. SEQ ID NOs:41, 109, and 177, respectively;
- o. SEQ ID NOs:42, 110, and 178, respectively;
- p. SEQ ID NOs:43, 111, and 179, respectively;
- q. SEQ ID NOs:44, 112, and 180, respectively;
- 15 r. SEQ ID NOs:45, 113, and 181, respectively;
- s. SEQ ID NOs:46, 114, and 182, respectively;
- t. SEQ ID NOs:47, 115, and 183, respectively;
- u. SEQ ID NOs:48, 116, and 184, respectively;
- v. SEQ ID NOs:49, 117, and 185, respectively;
- 20 w. SEQ ID NOs:50, 118, and 186, respectively;
- x. SEQ ID NOs:51, 119, and 187, respectively;
- y. SEQ ID NOs:52, 120, and 188, respectively;
- z. SEQ ID NOs:53, 121, and 189, respectively;
- aa. SEQ ID NOs:56, 124, and 192, respectively;
- 25 bb. SEQ ID NOs:57, 125, and 193, respectively;
- cc. SEQ ID NOs:58, 126, and 194, respectively;
- dd. SEQ ID NOs:59, 127, and 195, respectively;
- ee. SEQ ID NOs:60, 128, and 196, respectively;
- ff. SEQ ID NOs:62, 130, and 198, respectively;
- 30 gg. SEQ ID NOs:63, 131, and 199, respectively;
- hh. SEQ ID NOs:64, 132, and 200, respectively;
- ii. SEQ ID NOs:65, 133, and 201, respectively;
- jj. SEQ ID NOs:66, 134, and 202, respectively;
- kk. SEQ ID NOs:67, 135, and 203, respectively; or

ii. SEQ ID NOs:68, 136, and 204, respectively; or
 ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity
 determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity
 determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences
 of:

- a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
- b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
- c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
- d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
- e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
- f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
- g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
- h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
- i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
- j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
- k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
- l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
- m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
- n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
- o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively.

[00368] Embodiment 46 is the system of embodiment 45 or 45a, wherein the antigen binding fragment comprises:

- i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions, or
- ii. the single chain variable fragment comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220 or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.

[00369] Embodiment 46a is the system of embodiment 45 or 45a, wherein the antigen binding fragment comprises:

- i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof comprising one, two, three or more amino acid substitutions, deletions and/or insertions; or
 - 5 ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.
- [00370]** Embodiment 46b is the system of embodiment 45 or 45a, wherein the antigen binding
- 10 fragment comprises:
- i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428; or
 - ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220.
- 15 **[00371]** Embodiment 47 is the system of any one of embodiment 45 to 46b, wherein the CAR further comprises a polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR).
- [00372]** Embodiment 48 is the system of embodiment 47, wherein the polypeptide that binds specifically to FSHR comprises an amino acid sequence selected from the group consisting of
- 20 SEQ ID NOs:319-331.
- [00373]** Embodiment 49 is the system of any one of embodiments 36-47, wherein the CAR comprises a signal peptide having an amino acid sequence that is at least 90% identical to SEQ ID NO:340.
- [00374]** Embodiment 50 is the system of any one of embodiments 36-49, wherein the CAR
- 25 comprises a hinge region having an amino acid sequence that is at least 90% identical to SEQ ID NO:341.
- [00375]** Embodiment 51 is the system of any one of embodiments 36-50, wherein the CAR comprises a transmembrane domain selected from the group consisting of a CD8 α transmembrane domain, a CD28 transmembrane domain, a CD4 transmembrane domain, a CD3 ζ
- 30 transmembrane domain, a CD2 transmembrane domain, a 4-1BB transmembrane domain, an OX40 transmembrane domain, an ICOS transmembrane domain, a CTLA-4 transmembrane domain, a PD-1 transmembrane domain, a LAG-3 transmembrane domain, a 2B4 transmembrane domain, a BTLA transmembrane domain, and a GMCSFR transmembrane domain.

[00376] Embodiment 52 is the system of any one of embodiments 36-51, wherein the CAR comprises an intracellular signaling domain selected from the group consisting of a signaling domain of CD3 ζ , FcR γ , FcR β , CD3 γ , CD3 δ , CD3 ϵ , CD5, CD22, CD79 α , CD79 β , and CD66 δ .

5 [00377] Embodiment 53 is the system of embodiment 52, wherein the CAR comprises a co-stimulatory domain selected from the group consisting of a co-stimulatory domain of one or more of CD28, 4-1BB (CD137), CD27, OX40, CD27, CD40, PD-1, ICOS, lymphocyte function-associated antigen-1 (LFA-1), CD2, CD7, LIGHT, NKG2C, B7-H3, TNFRSF9, TNFRSF4, TNFRSF8, CD40LG, ITGB2, KLRC2, TNFRSF18, TNFRSF14, HAVCR1, LGALS9, CD83, and a ligand that specifically binds with CD83.

10 [00378] Embodiment 54 is the system of embodiment 36, wherein the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:370-379 and SEQ ID NOs: 448-450.

[00379] Embodiment 55 is the system of embodiment 45, wherein the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:358-367 and SEQ ID
15 NOs: 445-447.

[00380] Embodiment 56 is the system of any one of embodiments 36-55, wherein the CAR further comprises a dominant negative form of an inhibitor of a cell-mediated immune response of the immune cell.

[00381] Embodiment 57 is the system of embodiment 56, wherein the inhibitor of a cell-mediated immune response of the immune cell is a transforming growth factor β (TGF- β)
20 receptor.

[00382] Embodiment 58 is the system of embodiment 57, wherein the dominant negative form of the inhibitor comprises the amino acid sequence of SEQ ID NO:347.

[00383] Embodiment 59 is the system of any one of embodiments 56 to 58, wherein the CAR is
25 connected to the dominant negative form of the inhibitor via a 2A peptide coding sequence.

[00384] Embodiment 60 is the system of embodiment 59, wherein the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NO:390-419 and SEQ ID NOs: 460-468.

[00385] Embodiment 61 is an isolated antibody or antigen binding fragment, wherein the
30 isolated antibody or antigen binding fragment comprises:

- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;

- c. SEQ ID NOs:55, 123, and 191, respectively;
- d. SEQ ID NOs:61, 129, and 197, respectively;
- e. SEQ ID NOs:31, 99, and 167, respectively;
- f. SEQ ID NOs:32, 100, and 168, respectively;
- 5 g. SEQ ID NOs:33, 101, and 169, respectively;
- h. SEQ ID NOs:35, 103, and 171, respectively;
- i. SEQ ID NOs:36, 104, and 172, respectively;
- j. SEQ ID NOs:37, 105, and 173, respectively;
- k. SEQ ID NOs:38, 106, and 174, respectively;
- 10 l. SEQ ID NOs:39, 107, and 175, respectively;
- m. SEQ ID NOs:40, 108, and 176, respectively;
- n. SEQ ID NOs:41, 109, and 177, respectively;
- o. SEQ ID NOs:42, 110, and 178, respectively;
- p. SEQ ID NOs:43, 111, and 179, respectively;
- 15 q. SEQ ID NOs:44, 112, and 180, respectively;
- r. SEQ ID NOs:45, 113, and 181, respectively;
- s. SEQ ID NOs:46, 114, and 182, respectively;
- t. SEQ ID NOs:47, 115, and 183, respectively;
- u. SEQ ID NOs:48, 116, and 184, respectively;
- 20 v. SEQ ID NOs:49, 117, and 185, respectively;
- w. SEQ ID NOs:50, 118, and 186, respectively;
- x. SEQ ID NOs:51, 119, and 187, respectively;
- y. SEQ ID NOs:52, 120, and 188, respectively;
- z. SEQ ID NOs:53, 121, and 189, respectively;
- 25 aa. SEQ ID NOs:56, 124, and 192, respectively;
- bb. SEQ ID NOs:57, 125, and 193, respectively;
- cc. SEQ ID NOs:58, 126, and 194, respectively;
- dd. SEQ ID NOs:59, 127, and 195, respectively;
- ee. SEQ ID NOs:60, 128, and 196, respectively;
- 30 ff. SEQ ID NOs:62, 130, and 198, respectively;
- gg. SEQ ID NOs:63, 131, and 199, respectively;
- hh. SEQ ID NOs:64, 132, and 200, respectively;
- ii. SEQ ID NOs:65, 133, and 201, respectively;
- jj. SEQ ID NOs:66, 134, and 202, respectively;

- kk. SEQ ID NOs:67, 135, and 203, respectively; or
 - ll. SEQ ID NOs:68, 136, and 204, respectively; or
 - ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:
 - a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 - b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 - c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 - d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
 - e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
 - f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 - g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 - h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 - i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
 - j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 - k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 - l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 - m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 - n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively;
 - o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively; or
 a variant thereof comprising up to about 3 (such as about any of 1, 2, or 3) amino acid substitutions in the CDR regions,

wherein the isolated antibody or antigen binding fragment thereof specifically binds mesothelin, preferably human mesothelin.
- [00386]** Embodiment 61a is an isolated antibody or antigen binding fragment, wherein the isolated antibody or antigen binding fragment comprises:
- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;

- f. SEQ ID NOs:32, 100, and 168, respectively;
- g. SEQ ID NOs:33, 101, and 169, respectively;
- h. SEQ ID NOs:35, 103, and 171, respectively;
- i. SEQ ID NOs:36, 104, and 172, respectively;
- 5 j. SEQ ID NOs:37, 105, and 173, respectively;
- k. SEQ ID NOs:38, 106, and 174, respectively;
- l. SEQ ID NOs:39, 107, and 175, respectively;

 - o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively;
- wherein the isolated antibody or antigen binding fragment thereof specifically binds mesothelin, preferably human mesothelin.
- [00387]** Embodiment 62 is the isolated antibody or antigen binding fragment of embodiment 61 or 61a, wherein the antibody or antigen binding fragment comprises:
- i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions, or
 - ii. the single chain variable fragment comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220 or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.
- [00388]** Embodiment 62a is the isolated polynucleotide of embodiment 61 or 61a, wherein the antigen binding fragment comprises:

- i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or a variant thereof comprising one, two, three or more amino acid substitutions, deletions and/or insertions; or
 - 5 ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220, or a variant thereof, preferably the variant comprises one, two, three or more amino acid substitutions, deletions and/or insertions.
- [00389]** Embodiment 62b is the isolated polynucleotide of embodiment 61 or 61a, wherein the
- 10 antigen binding fragment comprises:
- i. the single domain antibody comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428; or
 - ii. the single chain variable fragment comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220.
- 15 **[00390]** Embodiment 63 is the isolated antibody or antigen binding fragment of any one of embodiments 61 to 62b, wherein the antibody or antigen binding fragment thereof is chimeric.
- [00391]** Embodiment 64 is the isolated antibody or antigen binding fragment of any one of embodiments 61 to 62b, wherein the antibody or antigen binding fragment thereof is human or humanized.
- 20 **[00392]** Embodiment 65 is an isolated nucleic acid encoding the isolated antibody or antigen binding fragment thereof of any one of embodiments 61 to 64.
- [00393]** Embodiment 66 is a vector comprising the isolated nucleic acid of embodiment 65.
- [00394]** Embodiment 67 is a host cell comprising the vector of embodiment 66.
- [00395]** Embodiment 68 is a pharmaceutical composition comprising the isolated antibody or
- 25 antigen binding fragment thereof of any one of embodiments 61 to 64 and a pharmaceutically acceptable carrier.
- [00396]** Embodiment 69 is a method of treating a cancer in a subject in need thereof, the method comprising administering to the subject the pharmaceutical composition of embodiment 68.
- 30 **[00397]** Embodiment 70 is a method of producing the antibody or antigen binding fragment thereof of any one of embodiments 61 to 64, the method comprising culturing a cell comprising a nucleic acid encoding the antibody or antigen binding fragment thereof under conditions to produce the antibody or antigen binding fragment thereof, and recovering the antibody or antigen binding fragment thereof from the cell or culture.

[00398] Embodiment 71 is a method of producing a pharmaceutical composition comprising the antibody or antigen binding fragment thereof of any one of embodiments 61 to 64, the method comprising combining the antibody or antigen binding fragment thereof with a pharmaceutically acceptable carrier to obtain the pharmaceutical composition.

- 5 [00399] Embodiment 72 is an isolated polynucleotide comprising a first nucleotide sequence encoding a fusion protein, wherein the fusion protein comprises, from the N-terminus to the C-terminus, a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR), and an extracellular domain, a transmembrane domain and an intracellular domain of a CD3 polypeptide selected from the group consisting of a CD3- γ , CD3- δ and CD3- ϵ chain.
- 10 [00400] Embodiment 73 is the isolated polynucleotide of Embodiment 72, wherein the extracellular domain of the CD3 polypeptide comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 433 to 435, respectively; the transmembrane domain comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 436 to 438, respectively; and the intracellular domain comprises an amino acid sequence selected from the
- 15 group consisting of SEQ ID NOs: 439 to 441, respectively.

[00401] Embodiment 74 is the isolated polynucleotide of Embodiment 72 or 73, wherein the first polypeptide comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 319-331.

- [00402] Embodiment 74a is the isolated polynucleotide of Embodiment 74, wherein the fusion protein comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 442-444.
- 20

- [00403] Embodiment 75 is the isolated polynucleotide of any one of Embodiments 72 to 74a, further comprising a second nucleotide sequence encoding a chimeric antigen receptor (CAR), wherein the CAR comprises: (a) an extracellular domain comprising an antigen binding fragment that binds specifically to a tumor antigen; (b) a transmembrane domain; and (c) an intracellular signaling domain.
- 25

[00404] Embodiment 76 is the isolated polynucleotide of Embodiment 75, wherein the CAR is the CAR of any one of Embodiments 10-11a and 20.

- [00405] Embodiment 76a is the isolated polynucleotide of Embodiment 76, wherein the CAR comprises a transmembrane domain selected from the group consisting of a CD8 α transmembrane domain, a CD28 transmembrane domain, a CD4 transmembrane domain, a CD3 ζ transmembrane domain, a CD2 transmembrane domain, a 4-1BB transmembrane domain, an OX40 transmembrane domain, an ICOS transmembrane domain, a CTLA-4 transmembrane
- 30

domain, a PD-1 transmembrane domain, a LAG-3 transmembrane domain, a 2B4 transmembrane domain, a BTLA transmembrane domain, and a GMCSFR transmembrane domain.

[00406] Embodiment 76b is the isolated polynucleotide of Embodiment 76, wherein the CAR comprises an intracellular signaling domain selected from the group consisting of a signaling domain of CD3 ζ , FcR γ , FcR β , CD3 γ , CD3 δ , CD3 ϵ , CD5, CD22, CD79 α , CD79 β , and CD66 δ .

[00407] Embodiment 76c is the isolated polynucleotide of Embodiment 76, wherein the CAR comprises a co-stimulatory domain selected from the group consisting of a co-stimulatory domain of one or more of CD28, 4-1BB (CD137), CD27, OX40, CD27, CD40, PD-1, ICOS, lymphocyte function-associated antigen-1 (LFA-1), CD2, CD7, LIGHT, NKG2C, B7-H3, TNFRSF9, TNFRSF4, TNFRSF8, CD40LG, ITGB2, KLRC2, TNFRSF18, TNFRSF14, HAVCR1, LGALS9, CD83, and a ligand that specifically binds with CD83.

[00408] Embodiment 77 is the isolated polynucleotide of Embodiment 76, encoding a protein having an amino acid sequence selected from the group consisting of SEQ ID NOs: 454-456.

[00409] Embodiment 78 is the isolated polynucleotide of any one of Embodiments 72 to 77, further comprising a third nucleotide sequence encoding a dominant negative form of an inhibitor of a cell-mediated immune response of the immune cell, preferably a dominant negative form a transforming growth factor β (TGF- β) receptor.

[00410] Embodiment 78a is the isolated polynucleotide of Embodiment 78, wherein the dominant negative form of the inhibitor comprises the amino acid sequence of SEQ ID NO:347.

[00411] Embodiment 79 is the isolated polynucleotide of Embodiment 78 or 78a, wherein the first nucleotide sequence, the second nucleotide sequence, and/or the third nucleotide sequence are connected to each other via a 2A peptide coding sequence.

[00412] Embodiment 79a is the isolated polynucleotide of Embodiment 79, wherein the first nucleotide sequence, the second nucleotide sequence, and the third nucleotide sequence are connected in the order of, from the N-terminus to the C-terminus, the first, second and third nucleotide sequences.

[00413] Embodiment 79b is the isolated polynucleotide of Embodiment 79, wherein the first nucleotide sequence, the second nucleotide sequence, and the third nucleotide sequence are connected in the order of, from the N-terminus to the C-terminus, the second, first and third nucleotide sequences.

[00414] Embodiment 79c is the isolated polynucleotide of Embodiment 79, wherein the first nucleotide sequence, the second nucleotide sequence, and the third nucleotide sequence are connected in the order of, from the N-terminus to the C-terminus, the third, first and second nucleotide sequences.

[00415] Embodiment 79d is the isolated polynucleotide of Embodiment 79, wherein the first nucleotide sequence, the second nucleotide sequence, and the third nucleotide sequence are connected in the order of, from the N-terminus to the C-terminus, the third, second and first nucleotide sequences.

- 5 [00416] Embodiment 79e is the isolated polynucleotide of Embodiment 79, wherein the first nucleotide sequence, the second nucleotide sequence, and the third nucleotide sequence are connected in the order of, from the N-terminus to the C-terminus, the second, third and first nucleotide sequences.

- 10 [00417] Embodiment 79f is the isolated polynucleotide of Embodiment 79, wherein the first nucleotide sequence, the second nucleotide sequence, and the third nucleotide sequence are connected in the order of, from the N-terminus to the C-terminus, the first, third and second nucleotide sequences.

[00418] Embodiment 80 is the isolated polynucleotide of Embodiment 79, encoding a protein comprising an amino acid sequence selected from the group consisting of SEQ ID NOs:469-471.

- 15 [00419] Embodiment 81 is a system for inducing activity of an immune cell and/or a target cell, the system comprising an engineered cell comprising a modified TCR complex comprising a fusion protein encoded by the polynucleotide of Embodiments 72-80.

EXAMPLES

- 20 [00420] The examples provided below are for purposes of illustration only, are not intended to be limiting unless otherwise specified. Thus, the invention should in no way be construed as being limited to the following examples, but rather, should be construed to encompass any and all variations which become evident as a result of the teaching provided herein.

[00421] **Example 1: Selection of anti-mesothelin antibodies**

- 25 [00422] The mesothelin binding domain to be used in the CAR construct was derived from the panning of phage libraries. The mesothelin binding domain used in the CAR construct can encompass scFv or sdAb.

[00423] Animal Immunization

- 30 [00424] An immunogen comprising recombinant human mesothelin protein having a C-terminal 6-His tag (R&D Systems, Cat#3265-MS; Minneapolis, MN) was mixed with adjuvant or PBS followed by injected to mice or camels. Typically, the animals were immunized 2-4 times with 1-week to 2-week intervals. After multiple rounds of immunization, immune reactions against the target antigen were assessed by serum titration through both enzyme-linked immune sorbent assay (ELISA) and flow cytometric assay.

[00425] Phage display library construction

[00426] Total RNA was extracted from lymphocytes of immunized mouse or immunized camel using TRIZOL[®] Reagent according to the manufacturer's protocol. cDNA was synthesized based on RNA template with an oligo(dT)₂₀ primer using PRIMESCRIPT™ 1st Strand cDNA Synthesis Kit according to the manufacturer's protocol. V_Hs and V_Ls were amplified from mouse cDNA for generation of scFv phage library. V_HHs were amplified from camel cDNA for generation of V_HH phage library.

[00427] Bio-panning and isolation of anti-mesothelin antibodies

[00428] The constructed scFv phage library and V_HH phage library were panned against human mesothelin protein and mesothelin expressing tumor cells, respectively. Output phage particles obtained via panning were used to infect exponentially growing *E. coli* TG1 cells to generate single clones for screening. Individual clones were picked randomly and screened for the binding capacity to mesothelin. Specific binders were selected and sequenced to identify unique anti-mesothelin scFv or sdAb clones.

[00429] **Example 2: Humanization of anti-mesothelin antibodies**

[00430] 3 anti-mesothelin camelid sdAbs clones: AS65233, AS80444 and AS80533 were selected for humanization. Briefly, CDR grafting approach was applied that 3 CDRs of sdAb were inserted into human framework, followed by several back mutations in framework region to sustain the structure and binding properties of antibodies. 3 humanized sdAb variants (VH4, VH5, VH6) were designed for AS65233, AS80444 and AS80533, respectively (SEQ ID NOs:420-428). To confirm the binding affinity of sdAbs, camelid sdAbs and humanized sdAbs fusion with human IgG1Fc were expressed and purified utilizing eukaryotic expression system. Surface plasmon resonance (SPR) was performed to determine the affinities of purified camelid sdAb and humanized sdAb to human mesothelin. As shown in Table 1, the affinity gap between of camelid sdAbs and humanized sdAbs is less than 3 times.

[00431] Table 1: affinities of anti-mesothelin sdAbs determined by SPR

sdAb	Analyte	ka (1/Ms)	kd (1/s)	KD (M)
AS65233	Human mesothelin	4.26E+05	8.34E-03	1.96E-08
AS65233VH4		5.07E+05	5.15E-03	1.02E-08
AS65233VH5		3.31E+05	8.39E-03	2.53E-08
AS65233VH6		4.50E+05	8.60E-03	1.91E-08
AS80444		3.18E+05	3.04E-02	9.57E-08
AS80444VH4		3.04E+05	4.05E-02	1.33E-07
AS80444VH5		2.53E+05	3.12E-02	1.23E-07
AS80444VH6		3.16E+05	3.29E-02	1.04E-07

AS80533	1.7E+05	5.2E-03	3.1E-08
AS80533VH4	1.5E+05	9.3E-03	6.3E-08
AS80533VH5	1.4E+05	6.6E-03	4.6E-08
AS80533VH6	1.4E+05	7.7E-03	5.3E-08

[00432] Example 3: Preparation of anti-mesothelin CAR constructs

- [00433]** The amino acid sequences of the complementarity determining regions (CDRs) of the anti-mesothelin scFv and sdAb fragments are provided in Table 2, and the full length anti-mesothelin scFv and sdAb amino acid sequences are provided in Table 3. Full CAR constructs were generated using a scFv or sdAb fragment of Table 2 with additional sequences to generate full CAR constructs. SS1 scFv (SEQ ID NO:313), which is mouse anti-mesothelin scFv, was used to generate a CAR construct as a reference (SS1 CAR). M5 scFv (SEQ ID NO:314), which is a human anti-mesothelin scFv, was used to generate a CAR construct as a reference (M5 CAR). TC-210, which is a previously described non-conventional CAR construct, comprising a humanized anti-mesothelin sdAb fusing to CD3 epsilon chain (SEQ ID:429), was also used to as a reference. A full length anti-mesothelin CAR construct contains from the N-terminus to the C-terminus: a CD8 α signal peptide (SEQ ID NO:340), a mesothelin binding domain scFv or sdAb (SEQ ID NOs:205-258 and SEQ ID NOs:420-428), a CD8 α hinge domain (SEQ ID NO:341), a CD8 α transmembrane domain (SEQ ID NO:342), a CD137 intracellular domain (SEQ ID NO:343), and a CD3 ζ intracellular domain (SEQ ID NO:345). A schematic representation of the anti-mesothelin CAR construct is shown in FIGS. 1A-1B. The CAR fragment was then cloned into lentiviral vectors to create a full length anti-mesothelin CAR construct in a single coding frame, using human EF1 alpha promoter for expression (SEQ ID NO:339). The resulting CAR backbone vector was named “PLLV-hEF1 α -mesothelin CAR.”

[00434] Table 2: anti-mesothelin scFv and sdAb CDR amino acid sequences

[00436] Example 4: Generation of anti-mesothelin CAR-T

[00437] Preparation of lentivirus

[00438] The lentivirus packaging plasmid mixture including pCMV- Δ R-8.47 and pMD2.G (Addgene, Cat#12259; Cambridge, MA) was pre-mixed with the vectors PLLV-hEF1 α -mesothelin at a pre-optimized ratio with polyethylenimine, followed by addition to the HEK293 cells. The supernatants were collected after overnight incubation. The virus-containing supernatants were filtered through a 0.45 μ m PES filter, followed by ultra-centrifugation for lentivirus concentration. The virus pellets were rinsed with pre-chilled DPBS. The virus was aliquoted properly, then stored at -80°C immediately. The virus titer was determined by measurement of transduction efficiency to supT1 cell line via flow cytometric assay.

[00439] Collection and transduction of T lymphocyte

[00440] Leukocytes were collected from healthy donors by apheresis. Peripheral blood mononuclear cells (PBMCs) were isolated using FICOLL-PAQUE™ PLUS Media according to manufacturer's protocol. Human T cells were purified from PMBCs using Pan T cell isolation kit (Miltenyi, Cat#130-096-535; Bergisch Gladbach, Germany), following manufacturer's protocol. The purified T cells were subsequently pre-activated for 48 hours with human T cell activation/expansion kit (Miltenyi, Cat#130-091-441) according to manufacturer's protocol in which anti-CD3/CD28 MACSiBead particles were added at a bead-to-cell ratio of 1:2. The pre-activated T cells were transduced with lentivirus stock in the presence of 7 μ g/ml polybrene. The transduced cells were then transferred to the cell culture incubator for transgene expression under suitable conditions.

[00441] Example 5: Evaluation of *in vitro* activities of anti-mesothelin CAR-Ts

[00442] *In vitro* cytotoxicity assay

[00443] OVCAR-8 cells, which is a human ovarian cancer cell line expresses both mesothelin and FSHR, were used as the target cell in the following studies to evaluate the activities of CAR-Ts. On day 5 or day 9 after transduction, transduced T cells were harvested and co-incubated with

an effector cell (CAR-T) to target cell (OVCAR-8) ratio of 7.5: 1 for 20 hours. SS1 CAR-T, M5 CAR-T and TC-210 were used as controls. The controls SS1 CAR-T and M5 CAR-T were used in all assays to compare assay variation and/or act as a control. Un-transduced T cells (UnT) were used as a negative control.

- 5 [00444] The cytotoxicity was determined by a lactate dehydrogenase (LDH) assay. The results showed that M5 CAR-T, AS51674 CAR-T, AS60676 CAR-T, TC-210, AS65233 CAR-T, AS65691 CAR-T, AS80444 CAR-T and AS80533 CAR-T exhibited strong anti-tumor activities *in vitro* against OVCAR-8 cells, while SS1 CAR-T showed inferior *in vitro* activities, UnT had no killing effect (FIG. 7 and FIG. 8).

10 [00445] IFN γ release assay

- [00446] Additionally, supernatant from the *in vitro* cytotoxicity assay were collected to assess CAR-induced cytokine release, *e.g.*, interferon gamma (IFN γ) release. As shown in FIG. 9 and FIG. 10, M5 CAR-T, AS51674 CAR-T, AS60702 CAR-T, AS91156 CAR-T, AS91189 CAR-T, AS92110 CAR-T, AS65233 CAR-T, AS65271 CAR-T and AS80533 CAR-T were stimulated by
15 OVCAR-8 to produce IFN γ , whereas SS1 CAR-T produced less IFN γ , while UnT produced little IFN γ .

[00447] Long-term expansion assay by repetitive stimulation

- [00448] Day 0 (4 days after transduction), 2×10^5 OVCAR-8 cells are plated in 6 well plates to establish a monolayer. Day 1, T cells are counted and 1×10^6 viable CAR⁺ T cells are plated on
20 top of the OVCAR-8 cells in fresh media in the absence of cytokines. Day 3, new 2×10^5 OVCAR-8 cells monolayers are plated as in day 0. Day 4, viable CAR-T cells are counted. Day 4, 1×10^6 CAR⁺ T cells from wells that expanded (have at least this number of cells) are re-plated on a new monolayer as on day 1. Process is repeated for 3-4 repeat stimulations. Fold expansion after each stimulation is calculated as [viable CAR⁺ T cells on day 4]/ 1×10^6 , the amount of CAR-
25 T cells plated on day 1 of each stimulation. To normalize for cells discarded with each new stimulation, cumulative fold expansion is determined by [(fold expansion) $\times$ (fold expansion+1)...]. As shown in FIG. 11, after 3 rounds of co-culture with target cells, AS51674 CAR-T, AS80444 CAR-T, AS80533 CAR-T, AS80533VH4 CAR-T and AS60702 CAR-T exhibited better expansion capacity than M5 CAR-T and TC-210.

30 [00449] **Example 6: Evaluation of anti-mesothelin CAR-Ts in *in vivo* mouse model**

[00450] Anti-tumor activity of anti-mesothelin CAR-T was assessed *in vivo* in an OVCAR-8 xenograft model. 10×10^6 OVCAR-8 cells were implanted subcutaneously on day 0 in NOD scid gamma (NSG) mice. Once tumors were $150-200 \text{ mm}^3$, mice were randomized into treatment groups. 0.33×10^6 CAR positive T cells (M5 CAR-T, TC-210, anti-mesothelin CAR-Ts, UnT) in a

200µl dose was administered intravenously. Mice and tumors were monitored for about 60 days after tumor cell implantation.

[00451] As shown in FIG. 12, AS80533VH4 CAR-Ts efficiently eradicated tumor in mice and led to tumor free. AS80444 CAR-Ts also significantly regressed the tumor *in vivo*. However, M5
5 CAR-Ts inhibited the tumor growth by about 50%, whereas TC-210 could hardly inhibit the tumor growth. No tumor inhibitory effect was observed by infusion of UnT. 65 days after CAR-T infusion, 10×10^6 OVCAR-8 cells were re-challenged subcutaneously in AS80533VH4 CAR-Ts cured mice. While tumor kept growing in naïve mice, re-challenged tumor was eradicated in AS80533VH4 cured mice. These results demonstrated that AS80533VH4 CAR-Ts eradicate
10 tumor at a relatively a low dose (0.33×10^6 CAR positive T cells) and provide long-term protection (more than 100 days) *in vivo*.

[00452] Example 7: Detection of follicle stimulating hormone receptor (FSHR) expression on ovarian tumor cell lines

[00453] FSHβ 33-53 peptide (SEQ ID NO:319) was fused with Fc region of human IgG at the
15 C-terminus, then transiently produced and purified from HEK293F cells. Transient expression and purification in HEK293F cells was performed with standard methodology. Briefly, 100 ml of HEK293F cells at 3×10^6 cells/ml were transfected with 100µg plasmid and 300µg polyethylenimine. The cells were incubated at 37°C with 8% CO₂ and rotated at 80 rpm. After six days, the cells were harvested by centrifugation at $3500 \times g$ for 20 minutes. The supernatant was
20 purified by binding Fc fusion FSHβ 33-53 peptide to Protein A agarose beads. The protein was eluted with citrate buffer and dialyzed against phosphate buffered saline (PBS).

[00454] To confirm expression of FSHR on ovarian tumor cell lines, Fc fusion FSHβ 33-53 peptide (SEQ ID NO:332) was tested for its binding capacity to OVCAR-3 cells, OVCAR-8 cells and HEK293F cells (negative control) via flow cytometric assay. The fluorescence-activated cell
25 sorting (FACS) data (FIG. 13) shows that Fc fusion FSHβ 33-53 peptide specifically binds to OVCAR-3 and OVCAR-8 cells, and does not bind to HEK293 control cells, demonstrating FSHR expression on ovarian tumor cell lines.

[00455] Example 8: Preparation of FSHR TCR complex

[00456] FSHβ 33-53 peptide was fused to CD3 epsilon chain, gamma chain or delta chain for
30 TCR/CD3 complex signaling in a FSHR-dependent and MHC-independent manner. This TCR complex is named as FSHR TCR complex. Thus, a FSHR TCR complex comprises a fusion protein comprising, from the N-terminus to the C-terminus, a CD3ε, CD3γ or CD3δ signal peptide (SEQ ID NO:430-432), FSHβ 33-53 peptide (SEQ ID NO:319), a linker, a CD3ε, CD3γ or CD3δ extracellular domain (SEQ ID NO:433-435), a CD3ε, CD3γ or CD3δ transmembrane

domain (SEQ ID NO:436-438), and a CD3 ϵ , CD3 γ or CD3 δ intracellular domain (SEQ ID NO:439-441). A schematic representation of a FSHR TCR complex comprising a fusion construct with the FSH β 33-53 peptide fused to the CD3 ϵ extracellular domain is shown in FIGS. 2A-2B. Similar FSHR TCR complex with the FSH β 33-53 peptide fused to the CD3 γ or CD3 δ extracellular domain can also be prepared. The coding sequence for the fusion protein was then cloned into lentiviral vectors to create a FSHR TCR construct in a single coding frame, using human EF1 alpha promoter for expression. The resulting CAR backbone vector was named “PLLV-hEF1 α -FSHR TCR.”

[00457] Example 9: Preparation of FSHR/mesothelin tandem CAR constructs

[00458] FSH β 33-53 peptide was fused to anti-mesothelin CAR between the CD8 α signal peptide and the anti-mesothelin scFv or sdAb fragment to generate tandem CAR constructs containing mesothelin and FSHR binding domains. A linker sequence (selected from SEQ ID NOs:334-338) was used to link the C-terminus of the FSH β 33-53 peptide to the N-terminus of the anti-mesothelin scFv or sdAb fragment. Thus, a full length FSHR/ mesothelin tandem CAR contains from the N-terminus to the C-terminus: a CD8 α signal peptide, FSH β 33-53 peptide, a linker, a mesothelin binding domain scFv or sdAb, a CD8 α hinge domain, a CD8 α transmembrane domain, a CD137 intracellular domain, and a CD3 ζ intracellular domain. A schematic representation of the tandem CAR construct is shown in FIGS. 3A-3D. The CAR fragment was then cloned into lentiviral vectors to create a tandem CAR construct in a single coding frame, using human EF1 alpha promoter for expression. The resulting CAR backbone vector was named “PLLV-hEF1 α - tandem.”

[00459] Example 10: Preparation of mesothelin/FSHR dual CAR constructs

[00460] FSH β 33-53 peptide was used to generate a 2nd generation CAR construct comprising a CD28 intracellular domain and CD3 ζ intracellular domain. The FSHR targeting CAR was then linked to anti-mesothelin CAR at the C-terminus via a 2A element (SEQ ID NO:346). Thus, a full length mesothelin/ FSHR dual CAR contains from the N-terminus to the C-terminus: a CD8 α signal peptide (SEQ ID NO:340), a mesothelin binding domain scFv or sdAb (SEQ ID NOs:205-258 and SEQ ID NOs: 420-428), a CD8 α hinge domain (SEQ ID NO:341), a CD8 α transmembrane domain (SEQ ID NO:342), a CD137 intracellular domain (SEQ ID NO:343), a CD3 ζ intracellular domain (SEQ ID NO:345), a 2A element (SEQ ID NO:346), CD8 α signal peptide (SEQ ID NO:340), FSH β 33-53 peptide (SEQ ID NO:319), a CD8 α hinge domain (SEQ ID NO:341), a CD8 α transmembrane domain (SEQ ID NO:342), a CD28 intracellular domain (SEQ ID NO:344), and a CD3 ζ intracellular domain (SEQ ID NO:345). A schematic

representation of the dual CAR construct is shown in FIGS.4A-4B. The CAR fragment was then cloned into lentiviral vectors to create a dual CAR construct in a single coding frame, using human EF1 alpha promoter for expression. The resulting CAR backbone vector was named “PLLV-hEF1 α - dual.”

5 **[00461] Example 11: Preparation of mesothelin/FSHR CAR/TCR constructs**

[00462] The FSHR TCR was then linked to anti-mesothelin CAR at the C-terminus via a 2A element (SEQ ID NO:346). Thus, a full length mesothelin/FSHR CAR/TCR contains from the N-terminus to the C-terminus: a CD8 α signal peptide (SEQ ID NO:340), a mesothelin binding domain scFv or sdAb (SEQ ID NOs:205-258 and SEQ ID NOs: 420-428), a CD8 α hinge domain (SEQ ID NO:341), a CD8 α transmembrane domain (SEQ ID NO:342), a CD137 intracellular domain (SEQ ID NO:343), a CD3 ζ intracellular domain (SEQ ID NO:345), a 2A element (SEQ ID NO:346), a CD3 ϵ signal peptide (SEQ ID NO:430), FSH β 33-53 peptide (SEQ ID NO:319), a linker, a CD3 ϵ extracellular domain (SEQ ID NO:433), a CD3 ϵ transmembrane domain (SEQ ID NO:436), and a CD3 ϵ intracellular domain (SEQ ID NO:439). A schematic representation of the CAR/TCR construct is shown in FIGS. 5A-5B. The CAR fragment was then cloned into lentiviral vectors to create a CAR/TCR construct in a single coding frame, using human EF1 alpha promoter for expression. The resulting CAR backbone vector was named “PLLV-hEF1 α - CAR/TCR.”

[00463] Using similar methods, a mesothelin/FSHR CAR/TCR construct containing a FSHR TCR complex with the FSH β 33-53 peptide fused to the CD3 γ or CD3 δ extracellular domain can also be prepared.

[00464] Example 12: Preparation of CAR constructs armored with dnTGF β RII

[00465] The dominant negative TGF β RII (dnTGF β RII) was constructed by truncating the human TGF β RII to remove the intracellular kinase domain at residue 199 as originally reported (SEQ ID NO:347) (Wieser R, et al., *Molecular and cellular biology*. 1993; 13:7239-7247). The dnTGF β RII was linked to a CAR or components of a TCR complex via a P2A element at N-terminus or C-terminus. The dnTGF β RII armored anti-mesothelin CAR, dnTGF β RII armored FSHR TCR, dnTGF β RII armored FSHR/mesothelin tandem CAR, dnTGF β RII armored mesothelin/FSHR dual CAR, dnTGF β RII armored mesothelin/FSHR CAR/TCR were prepared respectively. Schematic representations of dnTGF β RII armored CAR and/or TCR constructs are shown in FIGS.6A-6L. The nucleic acid encoding a CAR and/or TCR construct was then cloned into a lentiviral vector to create a CAR construct with dnTGF β RII in a single coding frame, using

human EF1 alpha promoter for expression. The resulting CAR backbone vector was named “PLLV-hEF1 α -dnTGF β RII armored CAR.”

[00466] Example 13: Evaluation of *in vitro* activities of different CAR/TCR constructs

[00467] Lentivirus containing transgene of different CAR/TCR constructs were prepared as described above. CAR-T cells with different modalities (anti-mesothelin CAR, FSHR TCR, FSHR/mesothelin tandem CAR, mesothelin/FSHR dual CAR, mesothelin/FSHR CAR/TCR, dnTGF β RII armored CAR) were generated by transduction of lentivirus into primary T cells, respectively.

[00468] *In vitro* activities of anti-mesothelin CARs and FSHR/mesothelin tandem CAR

[00469] *In vitro* cytotoxicity of AS51674 CAR-T and AS51674 based FSHR/mesothelin tandem CAR-T were evaluated by LDH assay. FSH β 33-53 peptide was linked to AS51574 via a short linker or a long linker at N-terminus or C-terminus, followed by incorporated with 2nd generation CAR construct, corresponding to FSH33-53+AS51674-SL, AS51674+FSH33-53-SL, FSH33-53+AS51674-LL, 51674+FSH33-53-LL, respectively. The results indicated that FSHR/mesothelin tandems CARs had comparable killing efficacy against OVCAR-8 cells to anti-mesothelin CAR, while UnT had no killing effect (FIG. 14).

[00470] *In vitro* activities of anti-mesothelin CAR, mesothelin/FSHR dual CAR and mesothelin/FSHR CAR/TCR

[00471] *In vitro* cytotoxicity of AS51674 CAR-T, AS51674 based mesothelin/FSHR dual CAR-T, AS80533VH4 CAR-T, AS80533VH4 based mesothelin/FSHR dual CAR-T and AS80533VH4 based mesothelin/FSHR CAR/TCR-T were evaluated by LDH assay. The results indicated that AS51674 based mesothelin/FSHR dual CAR-T had comparable killing efficacy against OVCAR-8 cells to AS51674 CAR-T, AS80533VH4 based mesothelin/FSHR dual CAR-T, AS80533VH4 based mesothelin/FSHR CAR/TCR-T had comparable killing efficacy against OVCAR-8 cells to AS80533VH4 CAR-T, while UnT had no killing effect (FIG. 15).

[00472] *In vitro* activities of naked (no dnTGF β RII armored) CAR and dnTGF β RII armored CAR

[00473] As described previously, dnTGF β RII was linked to a CAR construct at N-terminus (dnTGF β RII+CAR) or C-terminus (CAR+ dnTGF β RII). *In vitro* cytotoxicity of AS51674 CAR-T and dnTGF β RII armored AS51674 CAR-T were evaluated by LDH assay. The results indicated that dnTGF β RII armored AS51674 CAR-T had better killing efficacy against OVCAR-8 cells than AS51674 CAR-T, while UnT had no killing effect (FIG. 16).

[00474] Besides, *in vitro* cytotoxicity of AS80533VH4 based mesothelin/FSHR dual CAR-T, AS80533 based mesothelin/FSHR CAR/TCR-T and corresponding dnTGFβRII armored CAR-T were evaluated by LDH assay. The results indicated that dnTGFβRII armored CAR-T had comparable killing efficacy against OVCAR-8 cells to naked CAR-T, while UnT had no killing effect (FIG. 17).

[00475] Additionally, supernatant from the *in vitro* cytotoxicity assay were collected to assess CAR-induced cytokine release, *e.g.*, interferon gamma (IFNγ) and tumor necrosis factor alpha (TNFα) release. As shown in FIG. 18 and FIG. 19, AS80533VH4 based mesothelin/FSHR dual CAR-T, AS80533 based mesothelin/FSHR CAR/TCR-T and corresponding dnTGFβRII armored CAR-T were stimulated by OVCAR-8 to produce comparable level of IFNγ and TNFα, whereas UnT produced little IFNγ and TNFα.

[00476] Example 14: *In vivo* efficacy comparison of anti-mesothelin CAR and mesothelin/FSHR dual CAR

[00477] Anti-tumor activity of AS51674 CAR-T and AS51674 based mesothelin/FSHR dual CAR-T were assessed *in vivo* in OVCAR-8 xenograft model. 10×10^6 OVCAR-8 cells were implanted subcutaneously on day 0 in NSG mice. Once tumors were 150-200mm³, mice were randomized into treatment groups. 0.33×10^6 CAR positive T cells in a 200μl dose was administered intravenously. As shown in FIG. 20, AS51674 based mesothelin/FSHR dual CAR-Ts efficiently eradicated tumor in mice, whereas AS51674 CAR-Ts hardly inhibited the tumor growth. No tumor inhibitory effect was observed by infusion of UnT.

[00478] Besides, anti-tumor activity of AS80533VH4 CAR-T and AS80533VH4 based mesothelin/FSHR dual CAR-T were also assessed *in vivo* in OVCAR-8 xenograft model. Similarly, 0.11×10^6 CAR positive T cells in a 200μl dose was administered intravenously into tumor bearing NSG mice when tumor reached 150-200mm³. As shown in FIG. 21, mesothelin/FSHR dual CAR-Ts efficiently eradicated the tumor in all of 4 mice and led to tumor free, whereas anti-mesothelin CAR-Ts only regressed the tumor in 3 out of 4 mice. No tumor inhibitory effect was observed by infusion of UnT. These results demonstrated that mesothelin/FSHR dual CAR-T had more potent anti-tumor efficacy than anti-mesothelin CAR-T *in vivo*.

[00479] Example 15: *In vivo* efficacy comparison of naked CAR and dnTGFβRII armored CAR

[00480] Anti-tumor activity of AS80533VH4 based mesothelin/FSHR dual CAR-T, AS80533 based mesothelin/FSHR CAR/TCR-T and corresponding dnTGFβRII armored CAR-T were

assessed *in vivo* in OVCAR-8 xenograft model. Similarly, 0.1×10^6 CAR positive T cells in a 200 μ l dose was administered intravenously into tumor bearing NSG mice when tumor reached 150-200mm³. As shown in FIG. 22, dnTGF β RII armored CAR-T inhibited the tumor growth more efficiently than corresponding naked CAR-T, for both mesothelin/FSHR dual CAR and
5 mesothelin/FSHR CAR/TCR. Moreover, mesothelin/FSHR CAR/TCR was a little bit more potent than mesothelin/FSHR dual CAR *in vivo*. No tumor inhibitory effect was observed by infusion of UnT. These results demonstrated that dnTGF β RII armored could enhance the *in vivo* efficacy of CAR-Ts.

10 [00481] It will be appreciated by those skilled in the art that changes could be made to the embodiments described above without departing from the broad inventive concept thereof. It is understood, therefore, that this invention is not limited to the particular embodiments disclosed, but it is intended to cover modifications within the spirit and scope of the present invention as defined by the present description.

CLAIMS

1. An isolated polynucleotide comprising a first nucleotide sequence encoding a fusion protein, wherein the fusion protein comprises, from the N-terminus to the C-terminus, a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR), and an
5 extracellular domain, a transmembrane domain and an intracellular domain of a CD3 polypeptide selected from the group consisting of a CD3- γ , CD3- δ and CD3- ϵ chain.
2. The isolated polynucleotide of claim 1, the extracellular domain comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 433 to 435, respectively; the transmembrane domain comprises an amino acid sequence selected from the group consisting of
10 SEQ ID NOs: 436 to 438, respectively; and the intracellular domain comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 439 to 441, respectively.
3. The isolated polynucleotide of claim 1 or 2, further comprising a second nucleotide sequence encoding a chimeric antigen receptor (CAR), wherein the CAR comprises: (a) an extracellular domain comprising an antigen binding fragment that binds specifically to a tumor
15 antigen; (b) a transmembrane domain; and (c) an intracellular signaling domain.
4. An isolated polynucleotide comprising a nucleotide sequence encoding a chimeric antigen receptor (CAR), wherein the CAR comprises:
(a) an extracellular domain comprising a first polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR) and an antigen binding fragment that binds
20 specifically to a tumor antigen;
(b) a transmembrane domain; and
(c) an intracellular signaling domain.
5. The isolated polynucleotide of any one of claims 1 to 4, further comprising a third nucleotide sequence encoding a dominant negative form of an inhibitor of a cell-mediated
25 immune response of the immune cell, preferably a dominant negative form a transforming growth factor β (TGF- β) receptor.
6. The isolated polynucleotide of any one of claims 1 to 5, wherein the first nucleotide sequence, the second nucleotide sequence, and/or the third nucleotide sequence are connected to each other via a 2A peptide coding sequence.
- 30 7. The isolated polynucleotide of any one of claims 1 to 6, wherein the first polypeptide comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 319-331, preferably, the fusion protein comprises an amino acid sequence selected from the group consisting of SEQ ID NO: 442-444.

8. The isolated polynucleotide of any one of claims 1 to 7, wherein the first polypeptide is connected to the extracellular domain of the CD3 polypeptide or the amino terminus or carboxy terminus of the antigen binding fragment via a linker.
9. The isolated polynucleotide of any one of claims 3 to 8, wherein the tumor antigen is
 5 selected from the group consisting of mesothelin, folate receptor α , mucin 16 (MUC16), prostate-specific membrane antigen (PSMA), human epidermal growth factor receptor 2 (HER2), epidermal growth factor receptor (EGFR), and vascular endothelial growth factor receptor (VEGFR).
10. The isolated polynucleotide of claim 9, wherein the tumor antigen is mesothelin,
 10 preferably human mesothelin.
11. The isolated polynucleotide of any one of claims 3 to 10, wherein the antigen binding fragment is a Fab, a Fab', a F(ab')₂, an Fv, a single-chain variable fragment (scFv), a minibody, a diabody, a single-domain antibody (sdAb), a light chain variable domain (VL), or a variable domain (V_HH) of a camelid antibody.
12. The isolated polynucleotide of claim 11, wherein the antigen binding fragment comprises:
 15 i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
- a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - 20 c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;
 - f. SEQ ID NOs:32, 100, and 168, respectively;
 - g. SEQ ID NOs:33, 101, and 169, respectively;
 - 25 h. SEQ ID NOs:35, 103, and 171, respectively;
 - i. SEQ ID NOs:36, 104, and 172, respectively;
 - j. SEQ ID NOs:37, 105, and 173, respectively;
 - k. SEQ ID NOs:38, 106, and 174, respectively;
 - l. SEQ ID NOs:39, 107, and 175, respectively;
 - 30 m. SEQ ID NOs:40, 108, and 176, respectively;
 - n. SEQ ID NOs:41, 109, and 177, respectively;
 - o. SEQ ID NOs:42, 110, and 178, respectively;
 - p. SEQ ID NOs:43, 111, and 179, respectively;
 - q. SEQ ID NOs:44, 112, and 180, respectively;

- r. SEQ ID NOs:45, 113, and 181, respectively;
- s. SEQ ID NOs:46, 114, and 182, respectively;
- t. SEQ ID NOs:47, 115, and 183, respectively;
- u. SEQ ID NOs:48, 116, and 184, respectively;
- 5 v. SEQ ID NOs:49, 117, and 185, respectively;
- w. SEQ ID NOs:50, 118, and 186, respectively;
- x. SEQ ID NOs:51, 119, and 187, respectively;
- y. SEQ ID NOs:52, 120, and 188, respectively;
- z. SEQ ID NOs:53, 121, and 189, respectively;
- 10 aa. SEQ ID NOs:56, 124, and 192, respectively;
- bb. SEQ ID NOs:57, 125, and 193, respectively;
- cc. SEQ ID NOs:58, 126, and 194, respectively;
- dd. SEQ ID NOs:59, 127, and 195, respectively;
- ee. SEQ ID NOs:60, 128, and 196, respectively;
- 15 ff. SEQ ID NOs:62, 130, and 198, respectively;
- gg. SEQ ID NOs:63, 131, and 199, respectively;
- hh. SEQ ID NOs:64, 132, and 200, respectively;
- ii. SEQ ID NOs:65, 133, and 201, respectively;
- jj. SEQ ID NOs:66, 134, and 202, respectively;
- 20 kk. SEQ ID NOs:67, 135, and 203, respectively; or
- ll. SEQ ID NOs:68, 136, and 204, respectively; or
- ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:
 - 25 a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 - b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 - c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 - d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
 - 30 e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
 - f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 - g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 - h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 - i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;

- j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 - k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 - l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 - m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 - 5 n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
 - o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively.
13. The isolated polynucleotide of claim 12, wherein the antigen binding fragment comprises:
- i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NO: 420-428; or
 - 10 ii. the single chain variable fragment comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220.
14. The isolated polynucleotide of any one of claims 4 to 13, wherein the extracellular domain of the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:348-357, or the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NO:370-379 and SEQ ID NOs: 448-450.
15. An isolated polynucleotide comprising a nucleotide sequence encoding a chimeric antigen receptor (CAR), wherein the CAR comprises:
- 20 (a) an extracellular domain comprising an antigen binding fragment that binds specifically to mesothelin, preferably human mesothelin;
 - (b) a transmembrane domain; and
 - (c) an intracellular signaling domain,
- wherein the CAR optionally further comprises a signal peptide at the amino terminus and a hinge region connecting the extracellular domain and the transmembrane domain, and wherein the
- 25 antigen binding fragment comprises:
- i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - 30 b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;
 - f. SEQ ID NOs:32, 100, and 168, respectively;

- g. SEQ ID NOs:33, 101, and 169, respectively;
- h. SEQ ID NOs:35, 103, and 171, respectively;
- i. SEQ ID NOs:36, 104, and 172, respectively;
- j. SEQ ID NOs:37, 105, and 173, respectively;
- 5 k. SEQ ID NOs:38, 106, and 174, respectively;
- l. SEQ ID NOs:39, 107, and 175, respectively;
- m. SEQ ID NOs:40, 108, and 176, respectively;
- n. SEQ ID NOs:41, 109, and 177, respectively;
- o. SEQ ID NOs:42, 110, and 178, respectively;
- 10 p. SEQ ID NOs:43, 111, and 179, respectively;
- q. SEQ ID NOs:44, 112, and 180, respectively;
- r. SEQ ID NOs:45, 113, and 181, respectively;
- s. SEQ ID NOs:46, 114, and 182, respectively;
- t. SEQ ID NOs:47, 115, and 183, respectively;
- 15 u. SEQ ID NOs:48, 116, and 184, respectively;
- v. SEQ ID NOs:49, 117, and 185, respectively;
- w. SEQ ID NOs:50, 118, and 186, respectively;
- x. SEQ ID NOs:51, 119, and 187, respectively;
- y. SEQ ID NOs:52, 120, and 188, respectively;
- 20 z. SEQ ID NOs:53, 121, and 189, respectively;
- aa. SEQ ID NOs:56, 124, and 192, respectively;
- bb. SEQ ID NOs:57, 125, and 193, respectively;
- cc. SEQ ID NOs:58, 126, and 194, respectively;
- dd. SEQ ID NOs:59, 127, and 195, respectively;
- 25 ee. SEQ ID NOs:60, 128, and 196, respectively;
- ff. SEQ ID NOs:62, 130, and 198, respectively;
- gg. SEQ ID NOs:63, 131, and 199, respectively;
- hh. SEQ ID NOs:64, 132, and 200, respectively;
- ii. SEQ ID NOs:65, 133, and 201, respectively;
- 30 jj. SEQ ID NOs:66, 134, and 202, respectively;
- kk. SEQ ID NOs:67, 135, and 203, respectively; or
- ll. SEQ ID NOs:68, 136, and 204, respectively; or
- ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity

determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:

- a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
 - b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
 - 5 c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
 - d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
 - e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
 - f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
 - 10 g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
 - h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
 - i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
 - j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
 - k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
 - 15 l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
 - m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
 - n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
 - o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively.
16. The isolated polynucleotide of claim 15, wherein the antigen binding fragment comprises:
- 20 i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NO: 420-428, or
 - ii. the single chain variable fragment comprising an amino acid sequences at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220,
- 25 preferably, the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:358-367 and SEQ ID NOs:445-447.
17. The isolated polynucleotide of claim 15 or 16, wherein the polynucleotide further comprises a second nucleotide sequence encoding a fusion protein, and the fusion protein comprises, from the N-terminus to the C-terminus, a first polypeptide that binds specifically to a follicle-
- 30 stimulating hormone receptor (FSHR), and an extracellular domain, a transmembrane domain and an intracellular domain of a CD3 polypeptide selected from the group consisting of a CD3- γ , CD3- δ or CD3- ϵ chain, preferably the nucleotide sequence encoding the CAR is connected to the second nucleotide sequence via a 2A peptide coding sequence.

18. The isolated polynucleotide of claim 17, wherein the extracellular domain of the CD3 polypeptide comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 433 to 435; the transmembrane domain comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 436 to 438, respectively; and the intracellular domain
5 comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 439 to 441, respectively.
19. The isolated polynucleotide of claim 15 or 16, wherein the polynucleotide further comprises a second nucleotide sequence encoding a second chimeric antigen receptor (CAR), wherein the second CAR comprises:
- 10 (a) an extracellular domain comprising a polypeptide that binds specifically to a follicle-stimulating hormone receptor (FSHR);
(b) a transmembrane domain; and
(c) an intracellular signaling domain,
wherein the second CAR optionally further comprises a signal peptide at the amino terminus and
15 a hinge region connecting the extracellular domain and the transmembrane domain,
preferably the nucleotide sequence encoding the CAR is connected to the second nucleotide sequence via a 2A peptide coding sequence.
20. The isolated polynucleotide of any one of claims 17-19, wherein the polypeptide that binds specifically to FSHR comprises an amino acid sequence selected from the group consisting of
20 SEQ ID NOs:319-331, preferably the fusion protein of claim 17 comprises an amino acid sequence selected from the group consisting of SEQ ID NOs: 442-444, or the isolated polynucleotide of claim 17 encodes a protein having an amino acid sequence selected from the group consisting of SEQ ID NOs:454-456; and the isolated polynucleotide of claim 19 comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:380-389 and SEQ ID
25 NOs:451-453.
21. The isolated polynucleotide of any one of claims 3-20, wherein the transmembrane domain in the CAR or the second CAR is independently selected from the group consisting of a CD8 α transmembrane domain, a CD28 transmembrane domain, a CD4 transmembrane domain, a CD3 ζ transmembrane domain, a CD2 transmembrane domain, a 4-1BB transmembrane domain, an
30 OX40 transmembrane domain, an ICOS transmembrane domain, a CTLA-4 transmembrane domain, a PD-1 transmembrane domain, a LAG-3 transmembrane domain, a 2B4 transmembrane domain, a BTLA transmembrane domain, and a GMCSFR transmembrane domain.
22. The isolated polynucleotide of any one of claims 2-21, wherein the intracellular signaling domain in the CAR or the second CAR is independently selected from the group consisting of a

signaling domain of CD3 ζ , FcR γ , FcR β , CD3 γ , CD3 δ , CD3 ϵ , CD5, CD22, CD79a, CD79b, and CD66d.

23. The isolated polynucleotide of claim 22, wherein the CAR or the second CAR independently comprises a co-stimulatory domain selected from the group consisting of a co-stimulatory domain of one or more of CD28, 4-1BB (CD137), CD27, OX40, CD27, CD40, PD-1, ICOS, lymphocyte function-associated antigen-1 (LFA-1), CD2, CD7, LIGHT, NKG2C, B7-H3, TNFRSF9, TNFRSF4, TNFRSF8, CD40LG, ITGB2, KLRC2, TNFRSF18, TNFRSF14, HAVCR1, LGALS9, CD83, and a ligand that specifically binds with CD83.
24. The isolated polynucleotide of any one of claims 4-8, wherein the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:370-379 and SEQ ID NOs: 448-450.
25. The isolated polynucleotide of any one of claims 3 and 15-24, wherein the CAR comprises an amino acid sequence selected from the group consisting of SEQ ID NOs:358-367 and SEQ ID NOs:445-447.
26. The isolated polynucleotide of any one of claims 1-25, further comprising a third nucleotide sequence encoding a dominant negative form of an inhibitor of a cell-mediated immune response of the immune cell, preferably the nucleotide sequence encoding the CAR or the second CAR is connected to the third nucleotide sequence via a 2A peptide coding sequence.
27. The isolated polynucleotide of claim 26, wherein the inhibitor of a cell-mediated immune response of the immune cell is a transforming growth factor β (TGF- β) receptor.
28. The isolated polynucleotide of claim 27, wherein the dominant negative form of the inhibitor comprises the amino acid sequence of SEQ ID NO:347.
29. The isolated polynucleotide of claim 27, wherein the isolated polynucleotide encodes a protein having an amino acid sequence selected from the group consisting of SEQ ID NOs:390-419, SEQ ID NOs:460-468, SEQ ID NOs:457-459 and SEQ ID NOs:469-471.
30. An isolated antibody or antigen binding fragment, wherein the isolated antibody or antigen binding fragment comprises:
 - i. a single domain antibody (sdAb) comprising a complementarity determining region 1 (CDR1), CDR2 and CDR3 having the polypeptide sequences of:
 - a. SEQ ID NOs:34, 102, and 170, respectively;
 - b. SEQ ID NOs:54, 122, and 190, respectively;
 - c. SEQ ID NOs:55, 123, and 191, respectively;
 - d. SEQ ID NOs:61, 129, and 197, respectively;
 - e. SEQ ID NOs:31, 99, and 167, respectively;

- 5 f. SEQ ID NOs:32, 100, and 168, respectively;
g. SEQ ID NOs:33, 101, and 169, respectively;
h. SEQ ID NOs:35, 103, and 171, respectively;
i. SEQ ID NOs:36, 104, and 172, respectively;
j. SEQ ID NOs:37, 105, and 173, respectively;
k. SEQ ID NOs:38, 106, and 174, respectively;
l. SEQ ID NOs:39, 107, and 175, respectively;
m. SEQ ID NOs:40, 108, and 176, respectively;
n. SEQ ID NOs:41, 109, and 177, respectively;
10 o. SEQ ID NOs:42, 110, and 178, respectively;
p. SEQ ID NOs:43, 111, and 179, respectively;
q. SEQ ID NOs:44, 112, and 180, respectively;
r. SEQ ID NOs:45, 113, and 181, respectively;
s. SEQ ID NOs:46, 114, and 182, respectively;
15 t. SEQ ID NOs:47, 115, and 183, respectively;
u. SEQ ID NOs:48, 116, and 184, respectively;
v. SEQ ID NOs:49, 117, and 185, respectively;
w. SEQ ID NOs:50, 118, and 186, respectively;
x. SEQ ID NOs:51, 119, and 187, respectively;
20 y. SEQ ID NOs:52, 120, and 188, respectively;
z. SEQ ID NOs:53, 121, and 189, respectively;
aa. SEQ ID NOs:56, 124, and 192, respectively;
bb. SEQ ID NOs:57, 125, and 193, respectively;
cc. SEQ ID NOs:58, 126, and 194, respectively;
25 dd. SEQ ID NOs:59, 127, and 195, respectively;
ee. SEQ ID NOs:60, 128, and 196, respectively;
ff. SEQ ID NOs:62, 130, and 198, respectively;
gg. SEQ ID NOs:63, 131, and 199, respectively;
hh. SEQ ID NOs:64, 132, and 200, respectively;
30 ii. SEQ ID NOs:65, 133, and 201, respectively;
jj. SEQ ID NOs:66, 134, and 202, respectively;
kk. SEQ ID NOs:67, 135, and 203, respectively; or
ll. SEQ ID NOs:68, 136, and 204, respectively; or

ii. a single chain variable fragment (scFv) comprising a heavy chain complementarity determining region 1 (HCDR1), HCDR2, HCDR3, a light chain complementarity determining region 1 (LCDR1), LCDR2, and LCDR3, having the polypeptide sequences of:

- 5 a. SEQ ID NOs:1, 69, 137, 2, 70, and 138, respectively;
- b. SEQ ID NOs:19, 87, 155, 20, 88, and 156, respectively;
- c. SEQ ID NOs:23, 91, 159, 24, 92, and 160, respectively;
- d. SEQ ID NOs:25, 93, 161, 26, 94, and 162, respectively;
- e. SEQ ID NOs:27, 95, 163, 28, 96, and 164, respectively;
- 10 f. SEQ ID NOs:29, 97, 165, 30, 98, and 166, respectively;
- g. SEQ ID NOs:3, 71, 139, 4, 72, and 140, respectively;
- h. SEQ ID NOs:5, 73, 141, 6, 74, and 142, respectively;
- i. SEQ ID NOs:7, 75, 143, 8, 76, and 144, respectively;
- j. SEQ ID NOs:9, 77, 145, 10, 78, and 146, respectively;
- 15 k. SEQ ID NOs:11, 79, 147, 12, 80, and 148, respectively;
- l. SEQ ID NOs:13, 81, 149, 14, 82, and 150, respectively;
- m. SEQ ID NOs:15, 83, 151, 16, 84, and 152, respectively;
- n. SEQ ID NOs:17, 85, 153, 18, 86, and 154, respectively; or
- o. SEQ ID NOs:21, 89, 157, 22, 90, and 158, respectively;

20 wherein the isolated antibody or antigen binding fragment thereof specifically binds mesothelin, preferably human mesothelin.

31. The isolated antibody or antigen binding fragment of claim 30, wherein the antibody or antigen binding fragment comprises:

- 25 i. the single domain antibody comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:221-258 and SEQ ID NOs: 420-428, or
- ii. the single chain variable fragment comprising an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NOs:205-220.

30 32. An isolated nucleic acid encoding the isolated antibody or antigen binding fragment thereof of claim 30 or 31.

33. A vector comprising the polynucleotide of any of claims 1-29 and 32.

34. A host cell comprising the polynucleotide of any of claims 1-29 and 32 or the vector of claim 33, preferably, the cell is a T cell.

35. A method of treating a cancer, preferably an ovarian cancer, in a subject in need thereof, comprising administering to the subject a therapeutically effective amount of the host cell of claim 34.
36. An engineered immune cell expressing the CAR or TCR complex encoded by the
5 polynucleotide of any of claims 1-29.
37. The engineered immune cell of claim 36, wherein the engineered immune cell is selected from the group consisting of a cytotoxic T cell, a helper T cell, a natural killer T cell, a $\gamma\delta$ T cell, and a NK cell.
38. A pharmaceutical composition, comprising the engineered immune cell of claim 36 or 37
10 and a pharmaceutically acceptable carrier.
39. A pharmaceutical composition comprising the isolated antibody or antigen binding fragment thereof of claim 30 or 31 and a pharmaceutically acceptable carrier.
40. A method of treating a cancer, preferably an ovarian cancer, primary peritoneal carcinomas, pancreatic ductal adenocarcinoma (PDA), malignant pleural mesothelioma (MPM), lung
15 adenocarcinoma, triple negative breast cancer, endometrial cancer, biliary cancer, gastric cancer, or pediatric acute myeloid leukemia, in a subject in need thereof, comprising administering to the subject a therapeutically effective amount of the pharmaceutical composition of claim 38 or 39.
41. A method of engineering an immune cell, comprising introducing into the immune cell the polynucleotide of any of claims 1-29 operably linked to a promoter.
- 20 42. A method of producing a pharmaceutical composition, comprising combining the engineered immune cell of claim 36 or 37 with a pharmaceutically acceptable carrier to obtain the pharmaceutical composition.
