(54) Title: AN INHALER

(57) Abstract: An inhaler (70) is provided with a closure (5) which may be moved between a closed and open position in order to cover and uncover a mouthpiece (3). The closure (5) is associated with a revolvable element (6) comprising a restricting member (7). Movement of the closure (5) from the open position to the closed position causes the revolvable element (6) to revolve around an axis X thereby placing the restricting member (7) in a restricting position which restricts relative movement between a container unit (14) and the housing (1) such that unintentional actuation of the inhaler is prevented. The inhaler is useful, for example, in the treatment of asthma.
