A building element for a constructional building set

ABSTRACT

A building element for a constructional building set having coupling means for coupling to other building elements included in the building set by cooperation with their coupling studs arranged with mutual modular measures, said coupling means comprising flanges whose side faces are adapted to engage a plurality of the coupling studs on the other building element in a first number of orientations of the building element with respect to the other building element, said flanges being divided into sections so as to form edge faces which serve as engagement faces with the coupling studs in a second number of orientations of the building element.
