

COMMUNICATION DEVICE, COMMUNICATION METHOD AND PROGRAM

ABSTRACT

Provided is a communication device including: a first operating system that
5 executes commands belonging to a first command group; a second operating system
that executes commands belonging to a second command group different from the
first command group; and a determination unit that, when a first command belonging
to the first command group is received from an external device, inputs the first
command to the first operating system, when a first response is output from the first
10 operating system as a response to the first command, transmits the first response to
the external device, and when a second command belonging to the second command
group is output from the first operating system as a response to the first command,
inputs the second command to the second operating system and then inputs a second
response as a response to the second command output from the second operating
15 system to the first operating system.
