Abstract

A user terminal includes a receiving section that receives, via higher layer signaling, configuration information related to a physical uplink control channel (PUCCH) resource set including one or more physical uplink control channel (PUCCH) resources, and a control section that determines a PUCCH resource associated with a value of a certain field in downlink control information. According to an aspect of the present disclosure, an uplink control channel resource set can be configured that includes an appropriate number of uplink control channel resources.
