

ABSTRACT

An elevator device realizes destination floor registration with improved reliability by suppressing
5 erroneous registration due to unpredictable movement. The
elevator device has plural elevators 080, an information
terminal 050 owned by an elevator user, and a group
management control system 070 to select an elevator to be
arranged at an elevator hall from the plural elevators
10 based on information transmitted from the information
terminal. When the elevator user's movement route
corresponds with a movement route previously registered in
the information terminal, an elevator to be arranged at the
elevator hall is selected.
