

Abstract

SELECTION OPTION INFORMATION PRESENTATION SYSTEM AND METHOD

A selection option information presentation system includes a processor that executes a procedure. The procedure includes: displaying plural items of selection option information on a first display device in states in which a selection operation can be received, and, at a specific timing in a duration in which no selection operation is detected, modifying and displaying a display position of at least one or more items of selection option information set as a display target such that a combination of adjacent items of selection option information within a display region forms a combination in which a display position differs in an up-down direction or a left-right direction, or both; and, when a selection operation of any of the plural items of selection option information displayed on the first display device has been received, displaying the selection option information that received the selection operation on a second display device.
