

ABSTRACT

Provided in the present disclosure are a message sending method and apparatus, and a device and a storage medium. The message sending method comprises: receiving an input of a target message in a group session interface, and determining a receiving object for the target message, wherein the receiving object is at least one group member participating in a predetermined interaction event or at least one group member having a predetermined user attribute, and the at least one group member having the predetermined user attribute is a subset of all group members in a group; and sending the target message on the basis of the receiving object.
