ABSTRACT:

System and method for adapting the transmission rate to the line quality and modem suitable for such a system.

According to this system the local modems (1) and remote modems (3) having possible rates from 4800 bits/s to 19200 bits/s and from 4800, 9600 to 14400 bits/s respectively, can communicate at their common rates 4800, 9600 to 14000 bits/s by adapting their rate to the qualities of the transmission medium (85).

Application: Data transmission

Reference: Fig. 3.
