

ABSTRACT

DOOR CLOSING DEVICE

5 A restrictor of a door closing device includes a
shaft drive configured to move a pin holding member in a
direction away from a position of engagement between a pin
member and a door body fixed portion, and a shock absorber
configured to cushion an impact caused by collision
10 between components of the restrictor when a locked state
of a door body is released as the pin member is moved in
the direction away from the position of the engagement.
