

URINAL

Abstract

Problem: To provide a urinal capable of constraining the occurrence of uric scale in a discharge horizontal branch pipe even if flush water volume has been
5 reduced by water conservation.

Solution Means: A urinal, wherein a control unit 54 has: a main flush mode M0; a first equipment flushing mode M1 in which a portion of flush water flushes the upstream side of a connecting portion; and a second equipment flushing mode M2 in which a portion of flush water flushes the upstream side of the connecting
10 portion; wherein in at least one of either the first mode M1 or the second mode M2, the value of the discharge volume or the discharge instantaneous flow volume discharged is set to be equal to or greater than the value of the discharge volume or the discharge instantaneous flow volume in the main flush mode.
