

ABSTRACT

The present disclosure relates to methods and apparatuses for indicating information, methods and apparatuses for interpreting information, a base station, user equipment, and a computer-readable storage medium. A method of indicating information includes: generating
5 a resource allocation informing format which includes a first informing format indicating that each of reserve statuses in a physical resource block (PRB) resource allocation field is configured for indicating a resource allocation scheme, or a second informing format indicating that one or more of the reserve statuses in the PRB resource allocation field is configured for indicating an early termination of uplink transmission while each of remaining
10 reserve statuses is configured for indicating the resource allocation scheme; and sending the resource allocation informing format to UE. According to the foregoing embodiment, the UE can interpret a received current reserve status correctly even if the UE is configured simultaneously with two functions comprising an early termination of uplink transmission and a flexible resource allocation, thereby avoiding a confusion in behavior of the UE.
