

ABSTRACT

CARE PLAN CREATION ASSISTANCE SYSTEM, STORAGE MEDIUM, CARE PLAN CREATION ASSISTANCE METHOD, AND CARE PLAN CREATION ASSISTANCE PROGRAM

5 A care-plan creation support system is provided, which includes: a care-plan
outputting section that obtains, for each care plan, using a care-plan output support model,
a probability of improving a level of needed care for input of a care receiver situation, and
outputs a care plan for which the obtained probability is higher; a determination section
that determines whether or not the level of needed care after provision of care using the
10 outputted care plan to the care receiver has improved; a probability calculation section that
newly calculates, using a result of the determination by the determination section, the
probability of improving the level of needed care by the outputted care plan; and a
processing changing section that changes the care-plan output support model such that a
probability to be obtained for the outputted care plan for input of the care receiver situation
15 becomes close to the calculated probability.
