(54) Title: A CHILD'S BED

(57) Abstract: A child's bed comprises a sack (20) of a flexible material, which by a bottom (23) rests on the floor and which has the mouth part thereof connected to a rectangular frame (10). The frame (10) is formed of two frame parts, which are mutually connected via folding fittings that allow the frame parts to be folded into a parallel and overlapping relation. The frame (10) is provided with one obliquely outward downward sloping leg (13) in each corner. The legs are possible to fold back against the underside of the respective frame part (11) in order to lie within the area of the frame part. The free end (131) of the respective leg (13) is connected to an adjacent bottom corner (27) of the sack (20) in order to facilitate the folding-out and collapsing, respectively, of the bag (20) in connection with the erection and collapse, respectively, of the child's bed.
