(54) **Title:** MERGE MODE, ADAPTIVE MOTION VECTOR PRECISION, AND TRANSFORM SKIP SYNTAX

FIG. 5

(57) **Abstract:** An apparatus (for example, a decoder) may determine that affine mode is enabled for a video sequence. The apparatus may determine whether an affine mode adaptive motion vector difference resolution (AMVR) enablement indicator is present in a parameter set associated with the video sequence based on a value of an AMVR enablement indicator. If the value of the AMVR enablement indicator indicates AMVR mode is enabled for the video sequence, the apparatus may determine that the affine mode AMVR enablement indicator is present in the parameter set associated with the video sequence. If the value of the AMVR enablement indicator indicates AMVR mode is disabled for the video sequence, the apparatus may determine that the affine mode AMVR enablement indicator is not present in the parameter set associated with the video sequence. The apparatus may decode the video sequence accordingly.
