(54) **Title**: PROCESSING MONITOR SYSTEM AND METHOD

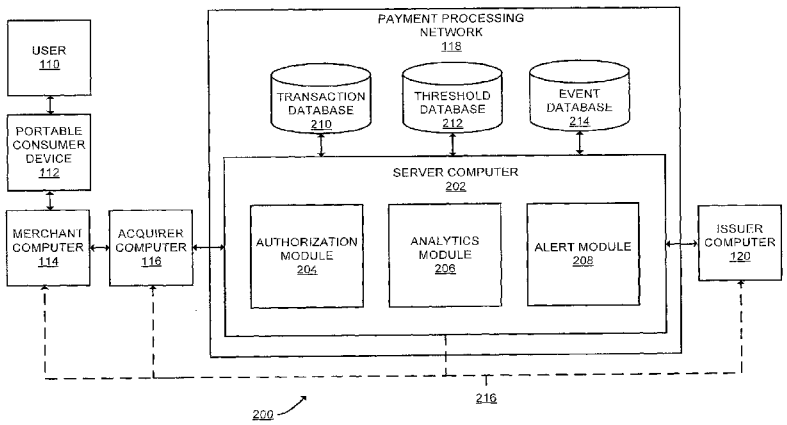

FIG. 2

(57) **Abstract**: Systems and methods for monitoring transaction data and providing an indication regarding a performance parameter to a payment processing entity. Transaction data associated with a plurality of transactions conducted during a time interval is received. A server computer determines that the received transaction data meets a threshold. It is further determined whether a previous indication that the threshold has been met was provided to a payment processing entity, the previous indication being associated with a plurality of previous transactions conducted during a previous time interval. If the previous indication was not provided, an indication that the threshold has been met is provided to the payment processing entity, the indication including information regarding a performance parameter of the payment processing entity.
