ABSTRACT

TRANSPORT CARRIER

The present invention provides a transport carrier for transporting a user or an object between points of differing elevation. According one embodiment, a transport carrier comprises a support frame (100) mountable along a stairway (60); a carriage (200) movably coupled to the support frame (100), and a cable coupled between the support frame (100) and the carriage (200). The carriage (200) is movable relative to the support frame (100) between a first position and a second position elevated and horizontally shifted relative to the first position. Pulling of the cable causes the carriage to move towards the second position, and releasing of the cable allows the carriage to move towards the first position.
