

PROCESSING APPARATUS

ABSTRACT

A processing apparatus that processes a workpiece includes a chuck table that holds the workpiece including multiple streets that intersect each other on a holding surface, a processing unit that processes the workpiece held by the chuck table along a corresponding one of the streets, and a controller. When processing is suspended with an unprocessed region left while the processing unit is caused to process the workpiece from one end to the other end of the street, the controller rotates the chuck table by 180 degrees and causes the processing unit to process the unprocessed region of the workpiece from the other end of the street.
