

BLOCKCHAIN TRANSACTION RECONCILIATION METHOD AND APPARATUS, AND ELECTRONIC DEVICE

ABSTRACT

One or more implementations of the present specification provide a blockchain
5 transaction reconciliation method and apparatus, and an electronic device. The method can
include: obtaining, by a blockchain member, a blockchain transaction record that is selected
from a blockchain and satisfies a specified condition. The blockchain member compares the
blockchain transaction record with an off-chain transaction record maintained by the
blockchain member. Whether the off-chain transaction record is inconsistent with the
10 blockchain transaction record is determined. In response to a determination that the off-chain
transaction record is inconsistent with the blockchain transaction record, the blockchain
member updates the off-chain transaction record based on the blockchain transaction record.
