

DATA PROCESSING METHOD AND SYSTEM

ABSTRACT

According to a data processing method and system provided in this specification, an identifier of a first data platform and corresponding first data are obtained in response to a data processing request of a target user; a data mapping relationship used to represent a correspondence between data fields in data templates of the first data platform and a second data platform is obtained based on the identifier of the first data platform; and the first data is parsed based on the data mapping relationship, to obtain second data of the second data platform. By using the data mapping relationship, the first data of the first data platform is converted into the second data that can be identified by the second data platform, to improve processing efficiency of exchange settlement limit accumulation of different platforms.
