DATA SYNCHRONIZATION METHOD AND SYSTEM, DATA PROCESSING METHOD AND SYSTEM, AND STORAGE MEDIUM

ABSTRACT

Embodiments of this specification provide a data synchronization method and system, a data processing method and system, and a storage medium. In the data synchronization method, a data synchronization system determines, from a first storage system, a source file that includes target data; then reads the target data from the source file, where at least some elements in the target data are encrypted in a partial encryption manner; and further generates, in the second storage system, a target file that encrypts plaintext data corresponding to the target data in a full encryption manner, so that a data processing system processes data in the target file.
