

Abstract

The invention relates to a method for installing an elevator system. In the method according to the invention, a shaft module (14) is set down on a pit element (13) to
5 form an elevator shaft of the elevator system. A car (22) of the elevator system is arranged in the shaft module (14). According to the invention, before the shaft module (14) is set down on the pit element (13), a safety element (40) is arranged in the shaft module (14) or in the pit element (13) so as to limit a downward displacement of the car (22) when the car (22) comes to rest on the safety element (40) during the downward
10 displacement. A safety space (66) in the pit element is thus ensured.
