NFC-BASED PAGE OPENING AND INFORMATION SENDING METHODS, APPARATUSES, AND DEVICES

ABSTRACT

One or more embodiments of this specification disclose NFC-based payment page opening methods, apparatuses, and devices, NFC-based information sending methods, apparatuses, and devices, and URL sending methods, apparatuses, and devices. This solution can include: After acquiring, from an NFC tag device based on a near field communication way, a first URL that includes a URL query identifier, a payment terminal device can determine, based on data already stored by the payment terminal device, a second URL that corresponds to the URL query identifier and that includes target information used to display a payment page; and can further display the payment page based on the second URL. A length of the first URL is less than or equal to a maximum number of bytes that can be transmitted by the NFC tag device based on the near field communication way at a time.
