

INFORMATION TRANSMISSION METHOD, COMMUNICATION APPARATUS, AND STORAGE MEDIUM

ABSTRACT

This application discloses an information transmission method, a communication apparatus,
5 and a storage medium, and relates to the field of communication. The method includes: A terminal
receives capability enquiry signaling from a network device; and sends capability information of
the terminal to the network device, where the capability information includes: a first capability
item and dual active protocol stack DAPS capability information supported by the terminal and
corresponding to the first capability item, and/or a second capability item and carrier aggregation
10 CA capability information supported by the terminal and corresponding to the second capability
item. In the method, the DAPS capability information supported by the terminal is reported to the
network device by using the first capability item, and/or the CA capability information supported
by the terminal is reported to the network device by using the second capability item, so that the
DAPS capability information and the CA capability information that are supported by the terminal
15 can be separately reported, so that both the CA capability information and the DAPS capability
information can be reported to the network device when the DAPS capability information is the
same as or different from the CA capability information.
