(54) Title: SPECTACLE ASSEMBLY FOR FACES WITHOUT A PROMINENT UPPER NASAL SUPPORT

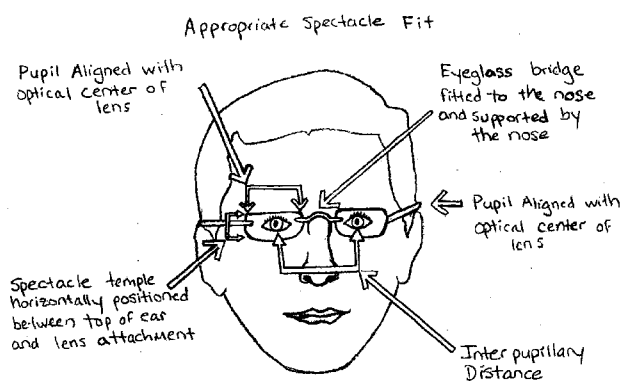

Fig. 1.
(Prior Art)

(57) Abstract: A spectacle assembly structured for use by individuals of different facial characteristics comprising a pair of lenses and a nose-bridge extending between the lens pair in interconnecting relation thereto. A nose pad assembly is connected to the nose-bridge and extends rearwardly thereof in supported engagement with a prominent nasal support on an individual's nose, wherein the location of the prominent nasal support is determined by the facial characteristics of the individual. The nose-bridge and the nose pad assembly are disposed in an operative position relative to the optical centers of the lens pair so as to facilitate substantial alignment between the optical centers and the pupils of the individual's eyes, when the nose pad assembly engages the prominent nasal support. When the prominent nasal support is disposed along the length of the individual's nose and in spaced relation to the nasal root of the individual's nose, the operative position of the nose-bridge and the nose pad assembly is preferably between the optical centers and the lower peripheral portions of the lens pair. As such, the spectacles may be comfortably and accurately worn by individuals having different facial characteristics including, but not limited to a less than prominent support area at the nasal root of the individual's nose.
