(54) Title: CARGO TRANSFER SYSTEM

(57) Abstract: A cargo transfer system for transferring cargo between two decks which may be subject to relative movements between each other is disclosed. The cargo transfer system includes a transverse member movably coupled to an elevated portion of a first deck (or a tower member on the first deck), and a side member movably coupled to the transverse member. In a deployment position, the side member is releasably coupled with a receiving base on the second deck. The cargo transfer system is actuatable by a relative movement between the first deck and the second deck to self-adjust for accommodating or countering the relative movement.
